That's about the same time I picked up two AA5s at the
church fair. An RCA 8X541 and a GE clock radio c435.
Neither too exciting at the time with respect to being
antiques, just old.

That's a cabinet built by Connor or Conner not sure which.
The radio is a AK model 36 which was their first AC powered
set. The separate power supply is in the lower cabinet
behind the model E speaker.

That was about the time I was putting the 17th coat of spar varnish on
my first RCA console to hide the splitting veneer. :(

It always seems that there is someone who passes the antique radio bug on to the next person. For me it was about 12 years ago, someone I know gave me a small tube tester, a westinghouse console radio, and a little advice. Since then, I have aquired several more radios, and although I still have a lot to learn, it has been a tonne of fun!!! Gonna have to buy my own house soon though.... with all the hobbies in this house, there is no more room for me anymore.

Source record: 18323

Hi,
I had a dusty RF2200 that I cleaned off with a painters brush, but there is a covering of grime that shows up under the right light. How do I safely wash these modern plastic cabinets and leave a nice, deep glow like the sets originally had? I can keep the washing solution away from any problem areas, but don't quite know what to use to get the desired affect. The RF2200 was dusted off because the dust gets into the switches (like the SW1 switch) and eventually the switch fails. Having cleaned all the switches, (the RF2200 is quite easy to work on) the set works perfectly, but I'd like to get it looking great too. Any help would be greatly appreciated.
rgds,
Mark S.

1935. Spencer Swap Meet, NEXT Saturday

Newsgroup: rec.radio.amateur.boatanchors

Spring is here in the Carolinas and it's time again
for our Spring Swap Meet at Spencer.

NEXT Saturday May 7th from about 8AM until around 12noon.
Admission is FREE, sellers pay just $5.

You can visit the Spring Swap Meet web page
at http://cc_awa.homestead.com/Spring.html
for details including driving directions.

If you've never attended the Spencer meet
it's a great place to bring the family since
it's on the grounds of the North Carolina Transportation Museum.
which has lots of vintage trains, antique cars, etc.

Come spend the day, radios in the morning and
trains in the afternoon.
But don't show up in the middle of the day expecting
to see any radios for sale.
These Saturday only events start early, and end usually
before 12noon.

Hope to see you there.

Ron

Hmmmm........ memories

Approximately 1972 or 1973, so I would have been 14 or 15 I guess. I remember hooking up to the tractor, the trailer cart that we were using to sell vegetables at my families roadside market garden. I drove a couple of miles down the next concession to us, loaded in a 1920's Columbia console, a lovely unit with two dors that slid on brass rails to hide inside the cabinet. My brother and I (he's 6 years younger than I) loaded it in, tied it down and headed home. Because I was too young to drive on the roads (or so they thought - little did they know :-)), I had to take the back lanes and the fields to get onto the concession. It's a wonder the radio made it! I still have it. It's in my dining room, some 33 years later.

cheers

Ahh 15, 16 , 17 and 18 years old. Thed early 70s.
I was down in the basement of the Staten Island Historical Society Museum
tinkering with the radio and phone collection. They had as I remember:
Several AK Model 20.
An AK Model 37 (AC powerered withj potted transformers made of green
metal) A Grebe-Eisman Synchrophase
Some GE units in wooden boxes (do not rememberany model info)
Several Victrolas.
Several Edison Cylinder Players
A real beautiful Regina Music Box that played 12 inch metal disks.
Much, mush more. A rela treasure trove.

Johnson Viking Invader 2000 LSB/USB/AM/CW
Please make serious offer.

All Lights and fans work too!!!! And of course I have the hook up cables.
And Also Comes with the Johnson Power Supply and works great.
They made a lower powered version Invader for 600.00 in the 60s and a high powered
version in the 60's High powered version was a whopping 1200.00 back then.
And this is the HIGH POWERED VERSION!!!! Only made a little over 300 of these transmitters. Its very rare to see one forsale.
Came from an estate and was tested and yes it works!! No hums at all.
One of the meters was sticky so you may have to spray with cleaner.
The power supply Works great and has no dents on it at all.
The Transmitter cabinet has no dents at all.
The Front panel on the Johnson Viking Invader 2000 is VERY NICE!!
The inside of the Invader is nice as well.
The only thing you would do is respray the both cabinets because they have paint chips off of them. And the bezel around the cabinet, But front is GREAT!

I found a site that gives info and I copied it, Here is what they say about this GEM>
The E. F. Johnson Viking Invader 2000 Transmitter was the high power version of the Invader 200. The exciter used a Crystal fitler for Single Side Band generation and had a power output of 160 watts thru 2 6146 finals. The Amplifier RF deck consisted of 2 4-400 Power Tubes running 2200 Volts on the plates. The Invader 2000 produced 2000 watts input power on SSB. Hence its name. The out board Power Supply the same size as the radio in volume and weighs about 125 Lbs. The neated thing about the Invader 2000 is the light orange glow of the 4-400s when they are working. The Invader 2000 was manufactured in 1961 and sold for $1229.00. The Invader 200 sold for $619.50.

That's a Grebe Synchrophase. There was another company, Eisemann Magneto Corp., that made some vaguely similar models, except that only their rheostats were horizontal, not the tuning dials. Freed-Eisemann (no relation) was also a well-known maker in the 1920s.

I find it interesting how peoples memory works,
or doesn't depending on how you look at it.
I remember years ago, talking to an old guy that was a friend
of my fathers, when he found out I collected old radios he asked
if I had a Kent Atwater... I told him he had the names switched
around and it was Atwater Kent.
He just stood me down, that I must not know much about
old radios if I didn't know about Kent Atwaters, he knew for
sure that was the name cause they had one when he was
growing up....

1957. FRS CONVERSION??

Newsgroup: rec.radio.amateur.boatanchors
Date: 2005-05-03 16:14:50 UTC
From: sefritts@comcast.net
Message-ID: <4277a2f1.446781@newsgroups.comcast.net>
Source record: 18246

hello all,

With all these super cheap FRS radios around, is it possible to reprogram/convert these trancievers to the 440 Amateur band?? I realize they would be probably simplex but seems if they can make these radios that cheap, why cant they do the same thing for the amateur 440 band??

From: "Kevin H. Phillips" <kh-phillips@9-5usa.org>
Message-ID: <3dpq4rF6pr1bkU2@individual.net>
Source record: 18247

I need the 3-position mode switch for a Heathkit TX-1 Apache
transmitter. Or, if anyone has just the center ceramic wafer for the
switch, that is the exact part I need. The one in a transmitter I have
is broken.

You may e-mail me direct.

Thanks very much,
Kevin Phillips

Yes, but for the most part the receive RF performance on the things is
so bad that it's not really worth the trouble.

On the other hand, it's no worse than the folks that used to move 49 MHz
walkie-talkies onto the 6M band. Nothing like writing "Teenage Mutant
Ninja Turtle Walkie-Talkie" on the back of the QSL card...

If you can get European models for the same price, it would be a much better deal. They already operate in the 446 mHz band.

Geoff.

I can't imagine why anyone would want to. FRS radios are, by
design, cheap, nasty, and poor performers where RF is concerned. You'd
get better performance out of an old Motorola HT-220 portable
(discontinued in 1979) than you would out of an FRS unit.

If you want some inexpensive radios for amateur 440 use, pop over
to Greed-Bay or your nearest ham radio swap meet, and poke around for
some Motorola HT600's or something similar. You'd be much better off,
and there are plenty of folk who can program and align them for you if
you lack the equipment to do so yourself (I know, because I'm one of
'em). ;-)

1966. FS: TM11-486 ELECTRICAL COMMUNICATION SYSTEMS 1945

Newsgroup: rec.radio.amateur.boatanchors
Date: 2005-05-04 11:14:00 UTC
From: Michael Crestohl <W1RC@notmyrealaddress.net>
Message-ID: <uibh71hafc3ic1c9bifkkjhh7u0l2k0162@4ax.com>
Source record: 18255

This is a very interesting Communications reference book from WW-II.
It was the intelligence bible of the period. Over 600 pages covering
telegraph, radio, telephony, teletype, power, etc. About 160 pages
are devoted to Radio and there is a lot of information on the neat
WW-II MIL radioequipment that is so popular today. There is an
interesting chapter on "Foreign" telephone systems and how to
interface it with Army equipment. The book is in good condition but
has some inkspots on the edge and some minor waterspotting on ten
cover. The spine has been reinforced with clear special library tape.
This was well done and the tape is still clear and flexible.

I am asking $150.00 or best offer for this rare item plus shipping
costs. I have only seen one other in the many years I have been
collecting this stuff. Several years ago I swapped a copy for a
R-390A metal cabinet......

If interested please reply by e-mail.

Hey, this brings to mind that I need about a dozen VHF HT-220 sets, preferably
tuned for the business band rather than 2M, but I'll take what I can get.
I'd sort of rather have them working.

Some of the European models sound interesting. I wish to take the opposite point of view regarding the FRS radios. We use Motorola radios for Search and Rescue, and we also use FRS radios. One of the advantage of the FRS radios is that the news media is not monitoring those channels and they do not go as far.

And, talk about sensitivity, one local boy made national news when he picked up some injured climbers on Mt. Hood, who had FRS radios. He was standing out in his dad's pasture about 70 miles distant from the injured climber and picked up a distress call. So, they some are sensitive. However, some radios may be better than others.

One real advantage of the FRS radios over the HT-220 is that you can pick up replacement batteries for the FRS radio for a buck or two at any store. The HT-220 battery is about $30 and must be charged. On a trip into the wild, the FRS blows away the HT-220 in terms of battery convenience and light weight. It may just be all the communication ability you need.

Source record: 18260

Have you tried a mild cleaner like Windex? You can spray it onto a soft cloth and apply, to avoid getting it into places where liquid doesn't belong. Something that's a little stronger is "Goof Off 2."

If the plastic is scuffed, you can restore the shine with Novus Plastic Polish #2. I have used that on all types of plastic, including delicate dial covers, with good results. Take it easy around painted letters. If you polish too hard, you may polish them right off. Novus #1 is an even milder polish.

WD-40 is a solvent (a mixture of kerosene and petroleum oil), so yes, it will dissolve grime. So will just about any other solvent, from paint thinner to acetone. But WD-40 will also leave an oily residue that eventually dries out and becomes gummy, attracting dirt.

I know that some people use WD-40 to "shine up" plastic and Bakelite, but that's not a good idea in my experience. Plastic and Bakelite cabinets were shipped from the factory with a clean, shiny surface, not with a coating of WD-40 or any other goo. If you do clean with WD-40, wash it off with something else when you're done.

Regards,

Phil Nelson

Here are a some items for sale. Prices do not include shipping. I am open to reasonable offers. I will ship overseas.

Heathkit SB-200.....$425 plus shipping
A nice clean 1 KW 80-10 meter linear amplifier that runs off of 110 VAC or 220 VAC. It uses a pair of 572B tubes. This amp is unmodified and in very nice shape with no extra holes and all of the correct knobs. Nothing has been arced or burned. The RCA input connector has been replaced with a PL-259. Puts out around 500 watts with 100 watts drive. Includes the original manual.

http://members.cox.net/radiodx3/sb2003.JPG
http://members.cox.net/radiodx3/sb2004.JPG
http://members.cox.net/radiodx3/sb2006.JPG

Yaesu FT-101EE 160-10 Meter Transceiver.....$350 plus shipping
This transceiver works on SSB, CW and AM. It also receives WWV on 10 MHz. The radio can be operated on both 110/230 VAC and 12 vdc with the appropriate power cord. Only the 110 VAC power cord is included as I don't have the other. The unit is in nice shape and works well. measured 100-120 watts out on a Bird wattmeter and the transmitted audio sounds excellent from on the air reports. Includes a Turner mobile microphone and a copy of the manual on a CD.

http://members.cox.net/radiodx3/ft101ee5.JPG
http://members.cox.net/radiodx3/ft101ee7.JPG

Homebrew HBR-15 Receiver.....$500 plus shipping
This is an AM-CW-SSB receiver. It uses plug-in coils and covers 80-10 meters and it has an additional set of coils which look like they may be for 6 meters. It uses three coils per band and It has all of the coils for 80-6. The box shows the coils. The 40 meter coils are in the receiver. The construction and wiring is is very well done and the National PW dial makes for very smooth tuning. I have had this in my shack for the past few weeks and used it to listen 40 meters. Their are two empty tube sockets near the front of the receiver which I believe are for mechanical filters which were not in the receiver when I got it. It plays very well, has nice sounding audio on SSB and AM and is quite impressive for a 40+ year old homebrew receiver. More information on HBR receivers and documentation may be found on the HBR Receiver Web Site at

http://members.cox.net/radiostuff9/hbr_1520.JPG

National RAS HRO Junior Reciever Coil Set and Box.....$275 plus shipping
The 5 coils are as follows: 1 - 190-450 kHz, 4 - 2-4 MHz (80/75 meters), 5 - 4-7 MHz, 6 - 7-14 MHz (40 and 30 meters)
and 7 - 14 -30 MHz (20, 15 and 10 meters). The coils and wooden box are in great shape. All coils work except coil 1 which has an open.

http://members.cox.net/radiostuff9/ras_coilset4.JPG
http://members.cox.net/radiostuff9/ras_coilset5.JPG

Hallicrafters SR-42.....$75 plus shipping
A separate transmitter receiver that puts out 5-6 watts and covers 144-148 MHz. This is a crystal controlled radio that also has provisions for the HA-26 VFO It will probably will work with other VFO's with an 24 MHz fundamental frequency. The transmitter uses 24 MHz crystals and includes two crystals for 145.14 MHz and 146.52 MHz. I used this for a while with the HA-26 VFO to check into our local 2 meter AM net. I recently obtained a Lafayette 2 Meter AM rig so this is surplus. The unit works well and has good audio. It does have some scratches and spots where the paint is missing. Includes the microphone, power cord (often missing) and a photocopy of the manual.
http://members.cox.net/radiodx3/hallisr42.JPG
http://members.cox.net/radiodx3/hallisr423.JPG

Electro-Voice EV-621L Dynamic Desk Microphone.....$50 plus shipping
Low impedance desk mike. Tested and working, the mike is in nice shape with a few minor scuffs.
http://members.cox.net/radiostuff9/ev621l.JPG

James Millen Frequency Meter Set I-129-(B) (Wavemeters).....$50 plus shipping
Military set of four James Millen wavemeters covering 1.5 to 40 MHz. This is the Signal Corps U.S. Army version and the box says manufactured by Munston Mfg. and Service. The wavemeters were manufactured by James Millen. These are in excellent condition. The wooden carrying case has the callsign of a previous owner. Here are the frequencies of each wavemeter:
*Meter No. 1: 1.5-3.5 MHz, *Meter No. 2: 3.5 - 8 MHz, *Meter No. 3: 8 -

18 MHz, *Meter No. 4: 18 - 40 MHz

John, there's one like it except in a pooley cabinet
listed on the bay now.
It has a model AK 33 which is the battery model
that was used to make the model 36 AC set.
It's a neat looking radio with the big E speaker
sticking through the front.

The Grebe Synchrophase was an amazing performer in its day, and
even now. I'd say it was the best unshielded TRF design ever made by
anyone. Grebe sold a lot of them, at $155.

1980. HW-101 VFO dial tracking accuracy

Newsgroup: rec.radio.amateur.boatanchors
Date: 2005-05-05 07:00:51 UTC
From: JOHN D <jawnd393one@yahoo.com>
Message-ID: <Dwjee.26170$lZ.8166@trnddc04>
Source record: 18269

I can get the VFO dial to be right on at both ends but up to 5khz (one division) off at mid dial
or right from 0 to 400 and 5k off at the 500 end.
I found a reccomendation about the using the lower coil peak point and it makes no difference.
How much dial accuracy can I expect fron this thing?
Any idea what to try to make it better?

Another question
I'm not sure whether to adjust the points for zero beat or peak meter deflection.

You want to use the zero beat. Max meter deflection will be up/down
from zero beat depending on mode.

The Zero Set control on the front panel is to 'tweak' the calibration
across the band where it may not line up perfectly. Utilizing it at
100kc points you should be able to get the calibration "as good as you
can interpolate" on the dial.

GL,
Bill

I've restored many HW-100s and HW-101s over the years.
The linearity is not all that great. If you're only
off by 5 KHz at the "500" end, that's fine. Use the
crystal calibrator and dial correction to line it up
when you're in that end of the band.

I returned the NC-270 ("mint, I can find nothing to fault on this receiver")two weeks ago. It cost me $35.50 to have it sent to me, but only $11.91 to return it, insured, to Martyn. I waited a week after UPS tracking said it was delivered, asked, and was told "I've been too busy to open it. I'll get it tomorrow." I waited another week, then filed a complaint with PayPal. I was told, "This will only delay your credit. Withdraw your complaint and I'll credit you right away." I left it with PayPal. Then I left Negative Feedback on Ebay. I think my negative was honest and restrained, "Equipment was over-represented, not Mint."

In reply I was called a liar. He stated that he had given me credit(he hasn't yet), and, oh my God, placed me on his "blocked bidders" list! That was the biggest blow, since I have learned nothing and want to throw more money down the rat hole!

1987. Freeing frozen Tune slugs

Newsgroup: rec.radio.amateur.boatanchors
Date: 2005-05-06 00:55:49 UTC
From: Jim <k0jkj@arrl.net>
Message-ID: <1115340948.667718.325430@g14g2000cwa.googlegroups.com>
Source record: 18276

I'm working on a SB-101 and a couple of the tuning slugs in the hetrodyne osc are frozen. Whats a good way to free them up? The 20 position is dead and I've swapped out the 20 meter crystal. I suspect the Plate tuned osc. isn't and would like to tweek it. The 15 meter slug turns and does a good job of insuring the osc starts or not depending on how it's tuned.

For those of you are not familiar with this style coil, they are made of wax? inpregnated paper and are tuned with a threaded ferrite slug with a hex shaped hole for the tuning wand. In the case of this rig 15 and 20 mneter crystals share a long coil form with seperate coils and slugs.

The 20 meter slug won't turn. It's stuck to the rather fragile paper tube all the way to one end of the form..

Thank you any and all advice.

73

Sam -

First, if you do not have the TS-520 Owner and Service Manuals, they can be found here (Adobe Acrobat):
http://www.kg6haf.com/kenwood.html

Next, this plug is the Cinch-Jones 12-pin (P-312-CCT) and it is available from either Cinch or Molex(old Beau) -- Rectangular Power Connectors - both Chicago based companies. You can ALSO order this from Kenwood parts:
E08-1202-05 TS-520 / TS-820 12P CONN. JACK $9.42

Mouser should have one or both mfg. in stock.
Cinch or Molex distributors / dealers will also have them)
Look on page 899 of the Mouser Internet catalog (pin layout 312) for the Cinch version
http://www.mouser.com/catalog/622/899.pdf

OR on page 905 for the Molex/Beau version (P-3312-CCT)
http://www.mouser.com/catalog/622/905.pdf

I would order at least 2 - and wire one for 120 VAC and the other for 13.8 VDC (that way you have both whenever you need them)

IF the 9-pin VFO jumper plug is missing on the back panel this is available from Kenwood Parts (E05-0901-05 TS-520/TS-820 9P VFO PLUG):
http://www.kenwoodparts.com

I assume that you can not turn the slug up or down?

In order not to break the ferrite slug - I would probably use a heat gun to
WARM UP the impregnated paper form - BUT not so much as to damage it.
and then try again -- not trying to break the slug

In my experience, frozen slugs are very often not actually frozen, but rather split in half lengthwise. When you try and turn the slug, the diddle stick cams the halfs of the slug apart, and makes it impossible to turn. The worse slugs for this problem are the square, or triangular hole type. The hex hole slugs will break this way too, especially if you use a steel allen key to turn them.

One way to free slugs that have this problem is to stabilize them by gluing a round toothpick in the hex hole. A drop of yellow carpenters glue will work nicely. Be sure to be frugal with the glue, you don't want it to touch the form in any way.

Need a manual? Maybe K4XL's BAMA can help. In the spirit of the "Old Internet," before all the spam and "For Sale" ads, The BoatAnchor Manual Archive offers almost 2000 manuals from over 200 different manufacturers for free downloading. Download whatever you need, but don't be a sleazebag and sell what you download on eBay. The manuals are available on two sites: http://bama.sbc.edu can serve only 10 users at the same time, but the mirror site at http://bama.edebris.com can take many more simultaneous connections.

Are the manuals on BAMA as good as those that the vendors provide? Sometimes, yes, and sometimes, no. In every case, the price is right!

Those wishing to contribute in BAMA please remember: do not use jpg to scan text or diagrams. BAMA recommend to use an algorithm called djvu. If you use that, please check that diagrams are OK before uploading, because I have seen djvu diagrams which are not really OK. If you would instead use lossless compression (e.g. gif) you would be safe for sure.

And please make also sure that diagrams are easily readable, and can be easily re-assembled when split across multiple sheets (magnification factor must be identical for all sheets).

Another recommendation: please do not upload "partial manuals". You may never know what someone else is interested in.

Source record: 18154

I have obtained an old receiver which has a metal plate attached to the
front panel, the details are:-

TYPE CKP - 46159 - A
RADIO RECEIVER
Serial 635
A UNIT OF MODEL TCS-15 RADIO EQUIPMENT
MANUFACTURED FOR
NAVY DEPARTMENT - BUREAU OF SHIPS
BY CONTRACTOR
AIR KING PRODUCTS CO. INC.

BROOKLYN NEW YORK
CONTRACT NXSR - 86279

The frequency ranges are 1.5 - 3 , 3 - 6, and 6 - 12 (Mc/s)
in three bands.
Can anyone identify this set, and/or point me to a website where I could
perhaps find out more?
Any assistance would be greatly appreciated.

Theo

I bought a Wireless Set 62 at the Dunstable Downs radio boot sale this afternoon. It looks to be in reasonable shape. I have already found and downloaded the circuit diagram and I understand there are some technical notes including alignment details, component list, service info etc etc. If anyone has the notes on the WS62 and could make me a copy I would be very grateful and would refund costs. If a scanned PDF that would be even better.

What you have is an example of a TCS receiver. There are numerous sites that will describe the equipment quite well. Its a WW2 vintage set, originally designed by Collins Radio, that was used by the Navy into the 60's (albeit as a standby, emergency set). Books and info are plentiful. If it hasn't been butchered, original connectors are available from Wm Perry Co. It requires 12v for filaments and about 220v for the B+. I currently have a TCS-13 system on the air with, of course, the companion transmitter, power supply, control box, and antenna tuner. They make for a very nice, usable, and collectable setup. A book for anything after the TCS-8 will give you the info you need to operate and service the unit you have. Many of the manual services have the books avaioable for purchase. Unfortunately, I don't have any manual copies left from a run I did a year or so ago. If you need a diagram, etc. I can provide those. You might check the BAMA website; they may have the TCS manual available... I don't recall. But, you do have a good "find" there.
Regards de K3HVG

First off, I will say that I have both uploaded & downloaded at BAMA. It's a most noble use of the Net.

OTOH, if you want to dl a complete set of something, how long does it take for you to do the dl & burn a CD? And as you do the dl, you are contributing to the congestion at BAMA.

Consider the picnic model. You want to go on a picnic next weekend, so do you start making and saving ice cubes a week in advance, or do you just buy a bag of ice at a convenience store? Sure, it's only a bag of very cold water, but I don't consider the seller a dirtbag. I'm making a decision for my convenience, based on how I value my time. And, from my perspective, $9 total (covering materials, labor, packaging, packing, postage & commissions) is not a way to get rich (unless you have a very poor day job).

Now, maybe as a BAMA contributor, could this seller be hurting me? I can't see how, since the material I contributed wasn't really my intellectual property, and the value I added by creating an electronic copy was always intended as a gift. And remember, I "contributed" the information, so I gave up any rights I might have had due to the nature of the transaction.

About the only "unfair" practice I could see would be the moral position of selling something which, but for the buyer's ignorance, could be obtained for free. OTOH, that ignorance fee is supposed to be the incentive to buyer enlightenment. <g>

I was admiring that National awhile back -- glad I passed it up.

Ya gotta give Radio Mart credit, the guy takes good pictures; kinda
like the used car dealers who shine their cars up so they look good
under the lights at night. The red velvet doesn't hurt either.

One huge problem is that this guy, if they are BAMA downloads, didn't do any of the real work of scanning and uploading. Then he didn't have to compile onto a web site or pay for that web site. THIEF is more the word that comes to mind. I also have uploaded a few manuals to BAMA for free use of everyone not to be sold. When I uploaded to BAMA I transfered my rights to K4XL not to some thief.

I have scanned about 25-30 manuals and uploaded them to BAMA. It is a
lot of work. It takes a considerable amount of time to scan them, crop
and make them look good. Periodically, someone will e-mail and ask me if
I would sell them a copy of a manual. I just e-mail it to them and do
the same when they get approached for a copy of a manual.

These guys are not just thieves but low life dirtbags and all for a few
dollars.

I have a Kenwood TS-120S HF Transceiver for sale. It has the Optional YK88C
CW Filter installed. It is complete except for
the 3 Black extention knobs for the Vox Controls that come out the top of
the cabinet. Radio needs some work. Receiver works fine, digital display
very
clear and stable. Front Panel is good. Cabinet has some scratches and
scuffs.
It will not go into transmit. When you key the mic, nothing happens. Was
working
fine before. Maybe the transmit/receive relay. Comes with the original
Manual.
No mic or Power Cord. Price is $135 plus shipping from 79602. Thanks,
Charlie Hugg, K5MBX

Source record: 18180

I have sent several manuals to the Bama site for posting. For several years, I even gave away manual copies twice a year for the cost of postage, if the person wanted to pay for it. These commercial dealers that flood the BA listings on eBay piss me off so much, I have blocked them from my search. On a regular basis, if you do a search of "Hallicrafters" out of 4 pages found, at least 2 are these..... vultures.

Message-ID: <tNVfe.1428$DC2.320@okepread01>
Source record: 18183

I have for sale in their original boxes 4 Jan 811A tubes. These are the good ones, made in the USA and great for Collins 30L-1s.
All 4 were made by Electronic Enterprises. I have checked them out in my 30L-1 and they are full output, no gas.
Price is $100 plus shipping from 79602.
I also have a nice Turner 90D-4 Mobile Mic FS. It is just like a Collins MM-1. Since Turner made the MM-1 for Collins, it is the same mic with a Turner lable. Wired for Collins. Price is $75. Thanks, Charlie Hugg, K5MBX CCA #307

2049. FS Or Trade Johnson Viking Invader 2000 LSB/USB/AM/CW

Newsgroup: rec.radio.amateur.boatanchors
Date: 2005-05-10 18:39:32 UTC
From: ritchi50@optonline.net
Message-ID: <fuv1819ffot7naj4s39g8gmp2etvti3q1e@4ax.com>
Source record: 18188

Johnson Viking Invader 2000 LSB/USB/AM/CW
Please make serious offer or will trade for equipment.
Just tell me what you're willing to trade for both Invader 2000 and
Power Supply.....Must be picked up in NJ.

Hi Everything worked until I moved the Transmitter and Power Supply
to another shelf, I was changing my equipment around.
When I went to use it a few days later one of the fuses went, so I put
in another fuse and it went. I found a bare wire near the fuse and
made sure it was not hitting anything and fuse didn't blow this time
but power supply doesn't turn on now?

They made a lower powered version Invader for 600.00 in the 60s and a
high powered
version in the 60's High powered version was a whopping 1200.00 back
then.
And this is the HIGH POWERED VERSION!!!! Only made a little over 300
of these transmitters. Its very rare to see one forsale.

The power supply has no dents on it at all.
The Transmitter cabinet has no dents at all.
The Front panel on the Johnson Viking Invader 2000 is VERY NICE!!
The inside of the Invader is nice as well.
The only thing you would do is respray the both cabinets because they
have paint chips off of them. And the bezel around the cabinet, But
front is GREAT!

I found a site that gives info and I copied it, Here is what they say
about this GEM>
The E. F. Johnson Viking Invader 2000 Transmitter was the high power
version of the Invader 200. The exciter used a Crystal fitler for
Single Side Band generation and had a power output of 160 watts thru 2
6146 finals. The Amplifier RF deck consisted of 2 4-400 Power Tubes
running 2200 Volts on the plates. The Invader 2000 produced 2000 watts
input power on SSB. Hence its name. The out board Power Supply the
same size as the radio in volume and weighs about 125 Lbs. The neated
thing about the Invader 2000 is the light orange glow of the 4-400s
when they are working. The Invader 2000 was manufactured in 1961 and
sold for $1229.00. The Invader 200 sold for $619.50.

What you discovered was not a high resolution image of the cover of
the manual, but rather a 38 page manual in djvu format. Do you have
the djvu plug-in installed in your browser? If so, the control panel
just above the "cover" will allow you to page through the manual.
Hope this helps.

>Out of curiosity, why djvu instead of pdf?

Fair question.

BAMA is a voluntary, cooperative effort. If someone submits a bunch
of gif, jpg, png or other format, individual page images, I am happy
to put it into pdf format. However, if someone submits a manual in
djvu format, that is the way it goes onto the server.

A careful reading of the BAMA site will reveal that I am very unhappy
with djvu because of support issues and encourage those who contribute
manuals to use pdf or raw image files. Still, there are those who
prefer djvu because of the phenomenal compression that it is capable
of. If they send me a manual that fits the BAMA mission, I'm
certainly not going to refuse it because it is in djvu format.

BAMA continues to grow because folks are willing to go to the trouble
to scan and share their manuals. I'm not about to do anything to
discourage that! 8*)

It's not you. It's a slow system and usually very busy so you have
to try during off hours. Hang in there.

Also, there is a construction manual for that rig there too so there
might be a clue in there for you.

Good luck.

Hi
Does anyone have crystals for the Drake TR-33C 2 meter tranceiver?
I have the following available for trade:
146.640
146.610
146.820
146.880
147.000

I want the following (some/any)
145.350
146.430
146.680
147.300

The crystal's marked frequency is the exact channel frequency.
The radio derives the output by some method which I don't know, but I can
get +/- 600 kHz and no offset as well

I am about to finish a complete restoration of a Heathkit HW-101 transceiver. It came with a HP-23B power supply. The power supply has listed low voltage settings for 275V and 350V. However, the manual calls for LV of 300 volts.

I don't want to blow up the radio; which LV setting, if at all, is correct for the HW-101?

Thanks for your help and advice.

Jim

It really is quite easy and inexpensive to get your crystals custom made by a number of different companies. Most all have web access and ordering. I have used JAN and had excellent results. The companies have information on file for virtually every piece of equipment that uses crystals... They certainly have your TR33C on file.

The usually scheme for making the radio work with a single crystal is to make the crystal be cut for the receive frequency, and mix it with three different crystals for transmit (LO+IF, LO+IF-600KHz, LO+IF+600KHz). The IF is most likely 10.7MHz.

-Chuck

Honestly, QMX will cut these things for you for less than ten bucks
each. You might as well just get custom cuts.

This is a nice RCA carrying "caddy" for vacuum tubes. It has one compartment on the bottom with two on each side of the top. Dimensions are 17" wide, 13 3/4" high and 8" deep. One of the lower compartments has a cover that snaps shut. This caddy will need a GOOD cleaning but it will clean up very nioely with a bit of elbow grease and TLC. It is structurally sound and will hold all your tubes in fine style. I am asking $20.00 plus shipping. No charge for "handling".

If interested please reply by e-mail.

Hi,

I'd say $450 for the amp with its own power supply,
and $125 for the spare power supply alone.

A drawback to the amp is the use of a 3-400Z tube,
with insufficient cabinet height
to permit use of the much cheaper 3-500Z.

73,
Ed Knobloch

Source record: 18220

Hello,

I don't know if a Kenwood TS-830S qualifies as a boatanchor but it probably does. I need a at Murata CFJ455 K12 or CFJ455 K5 ceramic filter to resurrect one. These are the small ceramic 455khz filters you would pull out of a transceiver to upgrade filters such as with Inrad filters etc.

Thanks,

Rick KC0HH

2087. found an nc-100 at a thrift shop anyone interested??

Newsgroup: rec.radio.amateur.boatanchors
Date: 2005-05-13 01:15:09 UTC
From: Bob in PHX <rbelisle1@cox.net>
Message-ID: <DcTge.40798$_K.22851@fed1read03>
Source record: 18226

I was at a phoenix area thrift shop today and found a very dirty, but complete national nc-100 (either xa or x I couldn't tell.

If someone wants it I am willing to go buy it and ship it. Its very dirty, has terrible aluminum corrosion on the trim, but it appears to be complete. The price was 110 bucks...

Email me for more details.

Digi-Key has a wide assortment of various 455 KC ceramics in various
widths and slopes, from Toko. They are a couple bucks each for the
higher end ones, so you can get a bunch of differnet kinds to try.

Hi All,
I found a box in the shack that I think has military headphones in it. It is titled: 5965-160-1055 Headset, Elecrtical HS16A. Inside the box is a foil envelope containing the headphones. The printing on the foil envelope says Mil-B-131D class2 RAP Industries Inc. Columbus, GA. August 1966.
Does anyone know what these are and what they might go with? Is there any value to these? The foil envelope is sealed shut and I would like to avoid opening it. Any help would be greatly appreciated.
rgds,
Mark S.

Where did I say I was looking for a fight? and I don't feel threatened,
you come burglarizing my home and you are the one looking for a fight
and will certainly feel threathened. You are the one who brought it up,
not me.

HS-16As were used with any of several radios from late WWII (replaced the HS-16s) to mid 60's as they were fairly universal: 520 Ohm dual elements; (I.E. 1000 ohms if in series; 250 ohms in parallel); 54 inch cord; phone tip connectors.

Besides radios - they were also specified for use on some military tube testers (ones that have "noise" monitor jacks - like the TV-10).

Last few I saw through ebay (used but good condition) went for $5 - $10 bucks. Your's being sealed should bring more.

BTW you noted RAP industries - is that correct? early ones (at least the HS-16s) were made by Murdock.

The same earphones are available new-in-box on e-bay from time to time. I believe they can be obtained BUY-IT-NOW for about 20 to 30 dollars. Fair Radio also had (perhaps still does) them for about the same price recently.

Happened to come across this one this evening while looking for National stuff.

http://cgi.ebay.com/ws/eBayISAPI.dll?ViewItem&item=5774641180&fromMakeTrack=true

The item he is selling is an NC-44 manual that I scanned and uploaded to BAMA.

What really annoyed me was it has my call letters on the front page. He was too lazy or did not know how to remove it.

Next time try call letters plus "if this is being sold to you by other
than the owner of these call letters a crime is being committed".

At least the SOB in question will have to do some work for their
money... ;-)

One way to stop these thieves is to have the BAMA site print on every page in bold letters "THIS MANUAL IS FROM THE BAMA MANUAL ARCHIVE" or some other wording. This placed on the front cover and table of contents might at least slow down the stupid thieves.

Any other legal ideas?

That's a good suggestion.

I know that I have previously argued that charging a fee to further distribute BAMA archived files would be acceptable to me (so long as the charge was only to defray materials & postage). But this guy goes over my limit, asking a sale price of $7.50 to $9, plus he's requiring another $3 for shipping. For just 1 or 2 manuals on a CD, that's way out of line. And yes, it looks like his whole operation is along the same model.\

Sigh, >4000 happy customers.

Get a life chuckie, I in no way was 'challenging' you to burglarize my
home, you are the one that first mentioned burglarizing. I simply said
if you do, then be prepared to face the consenquences.

>

Well good luck. I wouldn't want to toss water on your parade, but if the major
music and computer software firms fail at this; I wouldn't hold out much hope of
making it theft proof. The best I could recommend is that everyone boycott those
folks caught selling pirated material. Any efforts the make it harder would just be
a pain in the butt for all those who really appreciate the BAMA site and other
places that have help for those in need of assistance.

Thanks for the posting.... I wouldn't want to donate to a thief.

If you look at this guys completed auctions you will find his sale
percentage is pretty low. Considering the cost of ad placement on e-bay
I don't think this would be a very good business to get into. Maybe he
will figure this out and stop sell things that are not his.

I bought a couple of the ersatz HS-16's. They purport to be DSA surplus, but, and contrary to any DSA/DLSA/GSA contract requirement(s), there are absolutely no source markings on the unit or the package. There should be a "cage" code (manufacturer's code), valid contract number (the number listed does not show up on any procurement archive) and other required data. Also, note that the unit uses metric thread machining. DSA/DLSA would have (did!) specify ASA machining, at that time. It does get curiouser and curiouser, but who cares!! If the toobies want to believe that the TV-7 "specifies" this headset.. that's OK. If one want's to pay $90, that's OK, too. They are nice, imported copies of the old HS-16... even if they do crush your skull... out of the box!! HI!!
PS: Rap Industries are the folks that made the packing materials, not the headsets.

>Any other legal ideas?

Technically and legally, making a scan and uploading it doesn't
transfer any rights. "Thanks" to Disney, copyright can go back as
early as 1926. Some manuals may be old enough to be in the public
domain (I forget all the rules, but if it's more recent than 1925 you
should check), and a company having gone out of business does not
automatically make the manuals public domain (though it may reduce the
chance of there being anyone to sue you for infringement.
There was a recent thread on sci.electronics.design on copying of
older HP and Tektronix manuals, and of the companies still holding
copyright. Someone got a clarification from one of those companies (I
forget which) that manuals can be scanned and put on CDR's and traded
'at cost', but not made available for download on the Internet.
Whoever runs BAMA may want to read that thread to see what they might
have for download that the company might go after them for.

But I can understand the feelings against these ebay profiteers.

If you want to put them out of business (and presuming the specific
manuals being offered are public domain or permission is granted from
the copyright holders), sell them yourself on ebay for $1 or $2 each
or whatever copying and postage costs you. A fully loaded CDR should
be about $2 or $3 postpaid, and a printout of a scan at whatever it
costs, maybe postage plus 20 cents a page (whatever it costs to print
with those inkjet cartridges that are 2/3rds the price of a new inkjet
printer).

I did look at his completed auctions and it was pretty pathetic. I saw over 2000 completed auctions and I went through 10 pages and he sold less than 10% of what he had listed. With an average listing fee of 40 cents per auction, and a 10 % sell ratio that's a lot of money to throw out for listings. Not a very smart thief.

But legally most everything posted on BAMA *is* pirated material. As far as I know, only Agilent and Tektronix have given license for what BAMA is doing.

All these guys on ebay are doing is making BAMA's pirated material available on a different media.

On BAMA it is free to download, as opposed to ebay where the material is
up for sale. These scum are attempting to profit from the work of others
that is meant to be available for free.

That being said, all of the other after market manual providers will
not be able to provide copies either. Some have been doing this for
years.
Is there a difference between 'public domain' and 'pirated'? I think
so.

Anyway, IMO stealing is stealing.

Anyone half-competent with GIMP or PS could strip that in less than five
minutes.

The best thing is if you don't want it stolen, don't put it on the web.
Whicj of course, would defeat the purpose of BAMA.

2122. Astatic D-104 microphone

Newsgroup: rec.radio.amateur.boatanchors
Date: 2005-05-14 23:05:55 UTC
From: Bill Collins <biljanco@swbell.net>
Message-ID: <nvvhe.1641$sb5.138@newssvr12.news.prodigy.com>
Source record: 18108

I recently puchased a pair of Astatic D-104 microphones. One has the tug9 stand (with amp and nine position terminal strip in the bottom) the date stamp on the diagram in the base is 04-76. It has NO R/E switch as the following mic has.

The other one has an unmarked, repainted stand, amp, eight position terminal strip, and there is a switch next to the gain pot that has "R" on one side and "E" on the other. The diagram in the base has a revision date of 10-15-65, but a date stamp of 11-76 and is for an unamplified stand (may have been changed along the way).

I am curious about the second mic with the R/E switch in the base. What is it used for? None of the schematics I have found mention this switch. I don't find any real history on the different stands anywhere, even on the Astatic web site.

Someone has gone in and made other wiring changes for some reason, but my main question is still the R/E switch....after all the rambling.
Thanks,
Bill, N0RRY

Bill -

The second microphone that you are describing (with switch) sounds like it
has the Astatic T-UG8 stand/base. Here is a web page with many of the
Astatic base / stand schematics, should be helpful for you to re-wire the
stand per factory.
http://www.barovelli.com/radio/astatic/astatic.htm

I would suggest that you either "bookmark" the web page or save the desired
diagrams - electronically (right mouse button click -> save picture)

They do have a pretty good selection, but those SSB bandwidth units are not
available in this country anymore. About 2 years ago, Murata discontinued
their higher end filters.
The one that this fellow needs is what you generally find as the SSB filter
in the Icom and Yaesu receivers. I believe it is an 11-element unit.
Actually, it isn't bad.....my Icom 275A uses this particular filter.
Internet price on this filter, if you can find one, is about 20 dollars, but
that is a BIG but.

Hate to be a wet blanket, but how do you know that half of the stuff on BAMA is not pirated and should never have been posted there in the first place?

Not all old schematics & manuals are in the public domain. For instance, SAMS Technical Publishing, http://www.samswebsite.com/photofacts.html , is still alive and well, and they have an understandable interest in keeping people from distributing free, unauthorized copies of their Photofacts to the world.

Just because you buy a copy of something, scan it, and upload to the Internet, doesn't mean that it is "yours" to give away to the world.

If I scan the latest Tom Clancy novel and post his book on the Internet, I am violating his copyright, pure and simple.

The only exceptions would be if :

[A] I have Tom Clancy's permission to distribute free copies of his latest novel on the Internet,

or,

[B] I can prove in a court of law that Tom's copyright has expired or been abandoned for some reason.

If I don't have [A] or [B] on my side, then Tom kicks my butt and closes me down.

That said, I'm a supporter & lover of sites such as BAMA and www.nostalgiaair.org , which supply valuable information to people around the world. I have used these sites, and pointed fellow collectors to them. But I don't download or upload anything that I think is not authorized.

So, be careful about getting too outraged because somebody might be making an unauthorized copy of your uploaded copy which might also be unauthorized. You never owned the copyright in the first place.

Here are some links with more information about copyright:

http://www.whatiscopyright.org/

http://fairuse.stanford.edu/

http://www.templetons.com/brad/copyright.html

http://www.templetons.com/brad/copymyths.html

And, the ultimate authority:

http://www.copyright.gov/

Personally, if some dummy buys a "manual" from eBay instead of
downloading hit themselves from BAMA, they deserve exactly what they
get.

Agreed, they probably have a return percentage comparable to that of spam mail, with the difference they have to pay a fee to e-bay.

However a man who sells something that is freely available for everyone cannot be called a "thieve", he is just a poor man, who provides a "service" (that of downloading the file from BAMA, printing and advertising it over e-bay) to people accepting to pay something for that.

I would tend to rather be sorry with the buyers, than putting the blame on the sellers.

Going through a tube lot and found some tubes I cannot identify.

No markings on glass. Base is aluminum with ceramic. 4 pins. Number printed boldly on base is CIK 1660090. Made in USA.

Anyone have any ideas? Possibly related to Ham gear.

That has nothing to do with anything. If the material is on BAMA without the
permission of the copyright owners, giving it away for free is still theft.

Selling my personal collection of ARRL Radio Handbooks. These are all in excellent condition. Some of the best you will find. All prices plus shipping.

1931 Excellent condition throughout. The front cover has been creased at one time Price $40

1933 Excellent condition. Price $40

1934 Excellent condition. Hardbound. Price $45

1937 Excellent condition. Top and bottom of binding taped, but not torn. Don't know why it was taped. It looks almost mint otherwise. Price $40

1938 Very Good Condition. Binding Taped, but inside and covers in excellent condition. Price $30

1939 Poor condition. Missing covers but otherwise complete. Several handwritten schematics inside (on seperate paper) Binding is tight and all pages included. Price $15

1942 Special Defense Edition in Mint condition. Price $40

1942 Standard ARRL Handbook somewhat rare. in excellent condition. Price $40

1943 Excellent condition. Owners name written on cover. Price $35

1944 Excellent condition. Small 1" tear in top cover otherwise in near mint condition. Price $35.

1944 Excellent condition. Price $35.

1945 Very Good Condition. Cover torn away at top but still attached. Slightly worn spine. Price $25.

1948 Excellent condition Price $25

1949 Very Good Condition. Price $25

1950 Very Good Condition. Price $25

1951 Excellent condition. Price $25

1952 Good Condition. Spine Taped and owners name stamped in top right corner. Complete and tight binding. Price $20

1953 Excellent condition. Price $25

1955 Excellent condition. Price $25

1956 Excellent condition. Price $25

1957 Excellent condition. Near Mint. Price $25

1958 Excellent condition. Price $25

1959 Excellent condition. Price $20

1960 Mint hardbound edition. Price $30

1960 Mint softbount edition. Price $25

1961 Mint. Price $25

ALL PRICES PLUS SHIPPING FROM 27587.

Will consider ALL offers. Make me an offer on the whole lot. Might consider a trade of HF rig.

Thanks,

David,
W4IDX

... Actually, my opinion is that the .357 Magnum is a much better
handgun for personal protection... The .44 does indeed make a bigger
hole and has more impact energy, but the .357 creates much less flash
and recoil, making it easier to bring the .357 on target for a second
shot, should it be needed.

A .44 with that's been ported is MUCH more controllable ;-)

Thanks.
There are a few problems for me with getting custom crystals.
I'd have to get them across the border up here in Canada if I get them from
Jan, pay tax, more tax, brokerage and handling fees which would make it not
worth the price I'd end up paying on my rather limited budget.

It would be cheaper for me to buy another radio than buy a set of crystals.

And yes, I kind of figured that there would be heterodyning involved.

When it comes down to it, I have a nice synthesized rig but I'd like to set the Drake up for operation on some more useful frequencies in Vancouver BC, where I live.

Oh well, maybe I'll come across some crystals somewhere.

Not quite right. Unlike trademark, copyrights _cannot_ be 'abandoned'. A copyright owner can have failed to go after any infringer for 50 years, and then decides to go after _you_. "But everybody else is doing it, without being sued" is NOT a defense.

In the U.S. (although _not_ in many other countries), it is possible for a copyright holder to 'disclaim' their copyright rights, via an express statement that they are placing the work "in the public domain". That disclaimer, once made, cannot be withdrawn. Nor can the author prosecute for copyright infringement any action that occurs after the disclaimer.

>
>If I don't have [A] or [B] on my side, then Tom kicks my butt and closes me
>down.

Almost correct. :) Qualify it with "if he so chooses", and it is exactly correct. Given the probable dollar value losses due to the unauthorized copying, "if he so chooses" is a VIRTUAL CERTAINTY. And I'm picking a nit

that "effectively" makes no difference. <grin>

I'll just add the following caveats:
1) "Anonymous" works -- with no author named, *are* protected by copyright.
2) An inability to identify the current holder of the copyright does *NOT*
mean that one is free to copy that material. To avoid potential problems
one _must_ have the permission of the copyright holder(s).
3) When a company goes "out of business", *somebody* gets ownership of
the property that that company owned. That which is not sold is
distributed among the remaining owners of the company. In the case
of a corporation, this is anyone who still held shares at the time of
the dissolution. This gets *real* messy for intellectual property,
see item 2 above.
4) to be 'safe', if you don't have copyright owner permission, you better
be able to *prove* that copyright has expired, or has been disclaimed.

From the "devious suggestions" department:
1) Know anybody just "south of the border" you could have them shipped to?
2) failing that, consider renting a 'stateside' P.O. box, or a 'Mailboxes,
etc." or similar one.
3) failing that, you can have stuff shipped _to_ a Federal Express
facility (obviously only by Fed Ex) flagged "Hold for Customer
Pick-Up".

Then take a day-trip to Seattle, to collect em. Declare them on the return,
and you'll only pay the "tax and more tax", avoiding the brokerage/handling
outrageousness. Although that is "only" $5/package if they go through the
mail, vs the $35 and up, that the folks like UPS gouge you for.

In scenario #1, a receipt for, say, $1, for 'one lot, misc. radio crystals',
makes the 'tax and more tax' burden not quite so bad.

well, you have it backwards. Ignoring the issue of who owns the
copyright to manuals that are no longer available from the vendor
(sounds like they abandoned the copyright to me), the problem isn't
that some guy who is short on cash is downloading and selling copies
of the manuals, the problem is that no one has unloaded the entire
site to CD and isn't selling the "Hallicrafters 1959-1969", "The
Collins compendium" or "all tube SSB transmitters 1960 - 1979" or
whatever fills 500 meg of CD. Ten Bucks shipping included.

Some guy is selling Heathkit schematics on CD. I bought a disk and
the first week, needed a piece of info from it.

The first person who sells full 500 meg CDs at a low price puts
everyone else out of business AND solves the bandwidth problem on
BAMA.

I would pay 10 or so bucks for a FULL CD figuring that one manual on
it might be useful to me someday.

de ah6gi/4 Heathstuff (and some Collins 75S-1's, oh and an SX-100
too.

Nobody's making crystals in Canada anymore? There used to be, I have

no idea who if any still do, but it might be worth checking.

Snelgrove in Ontario used to, they even made crystal filters.

So, tell me, why do you feel so threatened that you need to announce
to the world (that is the audience here) that you are armed and looking
for a fight?

There was nothing in my post that could possibly make a literate person
believe I was planning to burglarize *your* home, and yet your first
instinct was to thump your chest and warn off all potential intruders.

The point being made, before you got scared, was that if you steal material,
it really makes no difference legally whether you give it away, or sell it.

This applies to copyright infringement, as well as to physical possessions.

-Chuck

2160. fraudulent eBay listing for Hallicrafters SX-28

Newsgroup: rec.radio.amateur.boatanchors
Date: 2005-05-16 22:38:41 UTC
From: Phil Nelson <philnelson@nospam.xyz>

eBay auction 6531717822 is fraudulent.

The Hallicrafters SX-28 shown there belongs to me, not to the "seller" in Lima, Peru. All of the photos and text were stolen from my website at:

http://antiqueradio.org/halli12.htm

I have notified eBay and asked them to cancel the auction.

The same person listed three other fraudulent auctions using photos and text from my website (for a TransOceanic A600L, a Sparton Bluebird, and a Scott 800B6 radio/tv/phono) in the last few days.

Caveat emptor.

> Do you have the "eBay name" of seller .. so I can track on watch list (to
> avoid)?

This person uses fake IDs, created a few minutes before the auction begins and discarded as soon as the auction ends (or is cancelled by eBay).

Anyhow, the two IDs that I saw were galatea1000 and nancyr552.

This person has used international eBay sites. The first two auctions were on eBay UK (http://www.ebay.co.uk/). I was alerted by a fellow collector in the UK who noticed that items from my US website were mysteriously for sale by someone in Peru. This SX-28 and Sparton Bluebird were listed on eBay Italia (http://www.ebay.it/).

Don't ask me how all of that works. I have never sold anything on eBay. If I were an unemployed slacker/hacker in the Third World and knew a bunch of guys just like me, I could probably convince a couple of them to spend a couple of hours a day setting up fake auctions, on the off chance that some sucker somewhere in the world might click the Paypal button to send you money for nothing.

The one thing shared by all four auctions was the purported location: Lima, Peru (listed as "lima, lima" in one auction and "lima, lima, lima, lima" in another.) Which was comical in the case of the auction for my Scott 800B radio/tv/phono console. It's a massive item, weighing well over 200 lb., and they said the shipping cost from Peru to the UK would be 30 British pounds. It would cost me at least that much to hire someone to haul it one mile down the street where I live.

You'd think eBay would make it moderately difficult to create a fake ID and sell nonexistent items. Perhaps not. Maybe I'll find some piece of junk in my garage and create a new account to sell it on eBay, just to find out what's involved.

> If you think you can get past the .44 magnum, go ahead.

You are challenging me to burglarize your house so you can try and
shoot me.

My hypothetical question, shown above was an attempt to help you to
understand that it doesn't matter whether or not a thief sells, or
gives away stolen property, a crime has still occurred.

... and I don't feel threatened,
> you come burglarizing my home and you are the one looking for a fight
> and will certainly feel threathened. You are the one who brought it up,
> not me.

I brought up the hypothetical question because you seemed to have missed
an important moral lesson in your upbringing. I hoped that a simple
example, that most anyone would understand, would help you to the see
the parallel between giving away stolen property, and selling stolen
property (hint, the word stolen says it all).

It would appear that there were a few more lessons missed.

Good luck with your life,

-Chuck

Yep -- it's an interesting problem. I recently read an article
about all the good computer code buried, and no longer available, from
outfits like Lernout and Hauspie, which produced the best available
voice recognition products. When the outfit went under, someone
acquired the rights to all that code. Apparently they didn't know the
actual value of it, so they chose not to let anyone have it for fear
of being undercompensated for it.

And then you brought up the subject of burglarizing someones home. Quite
a bit different than downloading some manuals that are even questionable
as to who may or may not have copyrights.

As long as you don't do something to warrent those violent things, then
you have nothing to worry about.

That is usually just bravado from cowards spouting off.

Anyone who should attempt to break into my home and I am there, will
find out for sure. That isn't hypothetical, that is a fact.

Hi to all!
I need if your help.
I have a lot of 400Hz Muirhead Servomotor-Tachometer generator mod.
15M81A,fom Mil surplus.
For 400Hz supply isn't a problem but I Don't have idea how to apply or
drive this servomotors.
This motor is supplied with a 115Vac primary plus two 13Vac control
windings, one tachometer 115 Vac primary with a secondary output.
Do you have some suggestion, scheme, application notes for use this motors
in a light CNC project?
Will be welcome application notes, schematic, literatures or URL's for
this devices..

I please you to reply by email, many thanks in advance and sorry for
bandwidht..

Ciao from Italy....

So people that steal manuals should be shot? And what does Mr. Kennedy, faggots, or liberals have to do with it. Defending your property or life is one thing but idle threats of violence really are uncalled for.

I'll bet I can still pee higher up the wall than you ;-p

Hammarlund? I can see the Collins and Drake connection. Low-boy
tube rigs with PTO's and good filters. Transceivers that ran in
cars on 12 VDC. Both made it well into the solid-state era. KWM-380
and TR-7.

Except for the HQ-215, wasn't Hammarlund just in the boat-anchor
era?

Heath, on the other hand, perfectly mirrored Collins and Drake.
Good VFOs, wide ranges of rigs and accessories. In fact, Heath
banged out more varieties and styles than either Collins or Drake.
I never saw a Collins or Drake keyer or standalone 6 meter
SSB/CW radio.

If Heath had a failing, it was in the mechanicals and presentation.

The best bezel on any Heath I've seen is on the DX-60. The rip-off
Starflite had a paint strip in place of the bezel.

The DX-60 is worth getting simply for the bezel. Compare that to
the SB-line, don't get me started on the HW's. More paint as a
bezel. What's that all about?

You Collins folk know the importance of a front panel.

de ah6gi/4 I really need to open my design lab

Folks,

I am after a multi-match modulation transformer of around 250 - 300 watt audio power rating. Something like a UTC CVM-4, Stancor A-3898, Ken-O-Tap T496, Woden UM-4 or Thordarson T-11M77 would suit.

I can't find one of these in the UK, probably because it would have been used in rigs above the UK license power limit. If you have one to spare and don't mind dealing with the packaging for shipping over here, then I will be pleased to hear from you.

2190. Re: Another BAMA Thief

Newsgroup: rec.radio.amateur.boatanchors
Date: 2005-05-18 18:11:08 UTC
From: dougmc@frenzy.com
Message-ID: <0zLie.102057$h6.7281@tornado.texas.rr.com>
Source record: 18029

In article <X8ghe.5425$iv.1939@news.cpqcorp.net>,
arne thormodsen <arneDOTthormodsen@REMOVE.hp.com> wrote:

| > What really annoyed me was it has my call letters on the front page.
| > He was too lazy or did not know how to remove it.
|
| Next time try call letters plus "if this is being sold to you by other
| than the owner of these call letters a crime is being committed".

But what crime exactly is being committed?

He may be infringing upon National's copyright on the manual itself (but the odds are good that National doesn't care -- I certainly have not asked them), but I don't see how BAMA could have a copyright on the item too. Merely scanning an item and making a PDF doesn't give you copyright rights to it, and while you may call it stealing or piracy (stealing from you) when they download it from your site and sell it to somebody else, I don't see how the law could agree with you.

Copyright covers `original works of authorship', according to http://www.copyright.gov/help/faq/faq-protect.html#what_protect. Merely scanning something created by somebody else hardly makes it an original work ...

If you want to claim copyright on something you've scanned, perhaps you should write a poem about ham radio or boat anchors or something, and put it on the very last page, along with the very clear `Copyright 2005 Bama' (which is not required, but it helps.) So even if the manual itself falls under somebody else's copyright, your poem is certainly yours, and you could prosecute for unauthorized reproduction of that. (Of course, it also makes it easier for somebody to prosecute YOU for unathorized reproduction of their manuals ...)

As for when exactly things fall into the public domain, this page is very useful --

http://www.unc.edu/~unclng/public-d.htm

as I understand it, most copyrights were not renewed when they actually had renewals, so the odds are somewhat good that things written before 1963 are in the public domain (especially things like manuals), and anything published before 1923 certainly is.

And no, I'm not a lawyer. And most of this is specific to the US, if that's not already clear. If you really want to pursue this, I'd suggest contacting a lawyer familiar with IP law.

| At least the SOB in question will have to do some work for their
| money... ;-)

... and they probably wouldn't.

No Collins but R.L. Drake had the TR-6 6 meter SSB CW XCVR

2193. Question re: Tek 7L12 Spectrum Analyzer

Newsgroup: rec.radio.amateur.boatanchors
Date: 2005-05-18 23:04:44 UTC
From: chuck <chuck@nospam.net>
Message-ID: <428bca03_1@newsfeed.slurp.net>
Source record: 18032

I'm in the market for a used spectrum analyzer like the 7L12 or the HP 141-T. One important use will be to make two-tone IMD measurements on HF SSB transmitters. I am concerned that with tone separations on the order of one kHz, the 7L12 may not have sufficient bandwidth in the 300 Hz mode to resolve adjacent IMD products expected to differ in amplitude by 40 dB or more.

Has anyone on the group used a 7L12 for this purpose and is the 300 Hz RBW sufficiently narrow?

There seems little doubt that the 141, with 10 Hz or 100 Hz RBW, will handle this.

Many thanks in advance.

I have never played with a 7L12 but do have a 141t. 300hz bandwidth will work. The best resolution on the 141t is 100hz. There is a 10 hz video filter but the video filter does no good for resolution. It only gets rid of noise. The biggest problem that I can imagine with the 7L12 would be whether or not your scope has some kind of storage or long persistency on the tube. To look at 300 hz bandwidth you need a very slow sweep speed on the scan. If there is no storage you will not be able to see it.

Source record: 18035

The memo that has "IMPEACH HIM" written all over it.

The top-level government memo marked "SECRET AND STRICTLY PERSONAL", dated eight months before Bush sent us into Iraq, following a closed meeting with the President, reads, "Military action was now seen as inevitable. Bush wanted to remove Saddam through military action justified by the conjunction of terrorism and WMD. But the intelligence and facts were being fixed around the policy."

Read that again: "The intelligence and facts were being fixed...."

For years, after each damning report on BBC TV, viewers inevitably ask me, "Isn't this grounds for impeachment?" -- vote rigging, a blind eye to terror and the bin Ladens before 9-11, and so on. Evil, stupidity and self-dealing are shameful but not impeachable. What's needed is a "high crime or misdemeanor."

And if this ain't it, nothing is.

The memo uncovered this week by the TIMES, goes on to describe an elaborate plan by George Bush and British Prime Minister Tony Blair to hoodwink the lanet into supporting an attack on Iraq knowing full well the evidence for war was a phony.

A conspiracy to commit serial fraud is, under federal law, racketeering. However, the Mob's schemes never cost so many lives. Here's more. "Bush had made up his mind to take military action. But the case was thin. Saddam was not threatening his neighbors, and his WMD capability was less than that of Libya, North Korea or Iran."

Really? But Mr. Bush told us, "Intelligence gathered by this and other governments leaves no doubt that the Iraq regime continues to possess and conceal some of the most lethal weapons ever devised."

A month ago, the Silberman-Robb Commission issued its report on WMD intelligence before the war, dismissing claims that Bush fixed the facts with this snooty, condescending conclusion written directly to the President, "After a thorough review, the Commission found no indication that the Intelligence Community distorted the evidence regarding Iraq's weapons." We now know the report was a bogus 618 pages of thick whitewash aimed to let Bush off the hook for his murderous mendacity. Read on: The invasion build-up was then set, says the memo, "beginning 30 days before the US Congressional elections." Mission accomplished. You should parse the entire memo -- reprinted below -- and see if you can make it through its three pages without losing your lunch. Now sharp readers may note they didn't see this memo, in fact, printed in the New York Times. It wasn't. Rather, it was splashed across the front pages of the

Times of LONDON on Monday.

It has effectively finished the last, sorry remnants of Tony Blair's political career. (While his Labor Party will most assuredly win the elections Thursday, Prime Minister Blair is expected, possibly within months, to be shoved overboard in favor of his Chancellor of the Exchequer, a political execution which requires only a vote of the Labour party's members in Parliament.)

But in the US, barely a word. The New York Times covers this hard evidence of Bush's fabrication of a casus belli as some "British" elections story. Apparently, our President's fraud isn't "news fit to print."

My colleagues in the UK press have skewered Blair, digging out more incriminating memos, challenging the official government factoids and fibs. But in the US press nada, bubkes, zilch. Bush fixed the facts and somehow that's a story for "over there."

The Republicans impeached Bill Clinton over his cigar and Monica's affections. And the US media could print nothing else. Now, we have the stone, cold evidence of bending intelligence to sell us on death by the thousands, and neither a Republican Congress nor what is laughably called US journalism thought it worth a second look.

My friend Daniel Ellsberg once said that what's good about the American people is that you have to lie to them. What's bad about Americans is that it's so easy to do.

[Here it is - the secret smoking gun memo
- discovered by the Times of London. - GP]

SECRET AND STRICTLY PERSONAL - UK EYES ONLY
DAVID MANNING

From: Matthew Rycroft

Date: 23 July 2002 S 195 /02

cc: Defence Secretary,Foreign Secretary, Attorney-General,
Sir Richard Wilson, John Scarlett, Francis Richards, CDS, C,
Jonathan Powell, Sally Morgan, Alastair Campbell

IRAQ: PRIME MINISTER'S MEETING, 23 JULY

Copy addressees and you met the Prime Minister on 23 July to discuss Iraq.

This record is extremely sensitive. No further copies should be made. It should be shown only to those with a genuine need to know its contents.

John Scarlett summarised the intelligence and latest JIC assessment. Saddam's regime was tough and based on extreme fear. The only way to overthrow it was likely to be by massive military action. Saddam was worried and expected an attack, probably by air and land, but he was not convinced that it would be immediate or overwhelming. His regime expected their neighbours to line up with the US. Saddam knew that regular army morale was poor. Real support for Saddam among the public was probably narrowly based.

C reported on his recent talks in Washington. There was a perceptible shift in attitude. Military action was now seen as inevitable. Bush wanted to remove Saddam, through military action, justified by the conjunction of terrorism and WMD. But the intelligence and facts were being fixed around the policy. The NSC had no patience with the UN route, and no enthusiasm for publishing material on the Iraqi regime's record. There was little discussion in Washington of the aftermath after military action.

CDS said that military planners would brief CENTCOM on 1-2 August, Rumsfeld on 3 August and Bush on 4 August.

The two broad US options were:

(a) Generated Start. A slow build-up of 250,000 US troops, a short (72 hour) air campaign, then a move up to Baghdad from the south. Lead time of 90 days (30 days preparation plus 60 days deployment to Kuwait).

(b) Running Start. Use forces already in theatre (3 x 6,000), continuous air campaign, initiated by an Iraqi casus belli. Total lead time of 60 days with the air campaign beginning even earlier. A hazardous option.

The US saw the UK (and Kuwait) as essential, with basing in Diego Garcia and Cyprus critical for either option. Turkey and other Gulf states were also important, but less vital. The three main options for UK involvement were:

(i) Basing in Diego Garcia and Cyprus, plus three SF squadrons.

(ii) As above, with maritime and air assets in addition.

(iii) As above, plus a land contribution of up to 40,000, perhaps with a discrete role in Northern Iraq entering from Turkey, tying down two Iraqi divisions.

The Defence Secretary said that the US had already begun "spikes of activity" to put pressure on the regime. No decisions had been taken, but he thought the most likely timing in US minds for military action to begin was January, with the timeline beginning 30 days before the US Congressional elections.

The Foreign Secretary said he would discuss this with Colin Powell this week. It seemed clear that Bush had made up his mind to take military action, even if the timing was not yet decided. But the case was thin. Saddam was not threatening his neighbours, and his WMD capability was less than that of Libya, North Korea or Iran. We should work up a plan

for an ultimatum to Saddam to allow back in the UN weapons inspectors. This would also help with the legal justification for the use of force.

The Attorney-General said that the desire for regime change was not a legal base for military action. There were three possible legal bases: self-defence, humanitarian intervention, or UNSC authorisation. The first and second could not be the base in this case. Relying on UNSCR 1205 of three years ago would be difficult. The situation might of course change.

The Prime Minister said that it would make a big difference politically and legally if Saddam refused to allow in the UN inspectors. Regime change and WMD were linked in the sense that it was the regime that was producing the WMD. There were different strategies for dealing with Libya and Iran. If the political context were right, people would support regime change. The two key issues were whether the military plan worked and whether we had the political strategy to give the military plan the space to work.

On the first, CDS said that we did not know yet if the US battleplan was workable. The military were continuing to ask lots of questions.

For instance, what were the consequences, if Saddam used WMD on day one, or if Baghdad did not collapse and urban warfighting began? You said that Saddam could also use his WMD on Kuwait. Or on Israel, added the Defence Secretary.

The Foreign Secretary thought the US would not go ahead with a military plan unless convinced that it was a winning strategy. On this, US and UK interests converged. But on the political strategy, there could be US/UK differences. Despite US resistance, we should explore discreetly the ultimatum. Saddam would continue to play hard-ball with the UN.

John Scarlett assessed that Saddam would allow the inspectors back in only when he thought the threat of military action was real.

The Defence Secretary said that if the Prime Minister wanted UK military involvement, he would need to decide this early. He cautioned that many in the US did not think it worth going down the ultimatum route. It would be important for the Prime Minister to set out the political context to Bush.

Conclusions:

(a) We should work on the assumption that the UK would take part in any military action. But we needed a fuller picture of US planning before we could take any firm decisions. CDS should tell the US military that we were considering a range of options.

(b) The Prime Minister would revert on the question of whether funds could be spent in preparation for this operation.

(c) CDS would send the Prime Minister full details of the proposed military campaign and possible UK contributions by the end of the week.

(d) The Foreign Secretary would send the Prime Minister the background on the UN inspectors, and discreetly work up the ultimatum to Saddam. He would also send the Prime Minister advice on the positions of countries in the region especially Turkey, and of the key EU member states.

(e) John Scarlett would send the Prime Minister a full intelligence update.

(f) We must not ignore the legal issues: the Attorney-General would consider legal advice with FCO/MOD legal advisers. (I have written separately to commissionthis follow-up work.)

Neat. I've never seen one.

While I'm nattering, and this is peripherally boatanchor related, is there any site that discusses all the QRP CW transmitter kits, those tuna-thingies, Ramsey, Vectronics kits?

I have several really nice HF boatanchor receivers, as in the Collins 75S-1 with the 500 cycle filter, Hallicrafters SX-100, and the SB-303. All work extremely well. In fact I bought several of these from regulars on this list, Mr. ARC5 and Jeep over in Maryland.

I'm not much of an operator but I thought it would be a real thrill to put these on the air as CW stations.

I got the Handbook boatanchor receiver QSK-Keyer kit from that fellow up in Pennsylvania and have been looking at the PTO kit, Manhattan style construction.

I could build a really nice QSK QRP CW transmitter that would work with my boatanchor collection, if I had a recommendation for a transmitter.

What fun that would be. Get up early in the morning or after work, fire up the 75S-1 or SX-100 and knock off a couple QSO's on CW, just like 1963 when I was a novice.

Just like 1963 but with better equipment.

My first transmitter was built from the "Ham Radio Projects You Can Build" book published by TAB. It used a single 6L6 tube, ran directly hot-chassis off the AC-line, and was crystal-controlled. Total parts cost would be minimal today other than the crystal, since you make all the coils yourself and there is no power transformer. Don't try it on 10M, but on 80M it was great. As I recall it was basically a Peirce oscillator.

Thanks for responding, Gary.

Sweep time is something that I had not even been
considering, so I appreciate the info.

From what I can gather about the 7L12, the slowest sweep is
10 mSec/division, or 0.1 second for a complete sweep. That
is the sweep setting Tek says to use for all frequency
domain analyses, regardless of bandwidth. The other sweep
settings go from 10 mSec/division to something like 1
uSec/division, but they are intended for time domain analyses.

As a reality check on a 0.1 second sweep, I looked at HP's
performance test procedure for the 8552B to see what sweeps
they specify for measuring the 8552B's bandwidth. For the
300 Hz RBW, they list a 0.2 second sweep (I assume that's
not 0.2 second/division). Not really too far from Tek's 0.1
second. Of course, at the narrower bandwidths, HP's
specified sweeps get much slower, as you pointed out. And if
it is 0.2 second/division, then there is a profound
difference between the Tek and HP filter designs or I'm
missing something big. As I recall, the slower sweeps are to
avoid ringing in the filters, gaussian skirts notwithstanding.

So maybe the 7L12 doesn't require a storage scope for the
300 Hz RBW? Sure wish I had access to the Tek Op manual for
the 7L12.

73,

Chuck

Hi Chuck,

I have used both the 141T system, and the 7L13. I ditched my 141T because the 7L5, 7L13, and 7L18 plugins perform better than the equivalent HP plugins for the 141T system, and are much more compact.

But,

When I was looking into 7L analyzers, I discounted the 7L12. It is too primative. The minimum you want to do any real work is a 7L13 with a 7633 storage frame. The 7L14 is much better because it has the digital storage, but it is also twice the price of a good 7L13.

You *will* need a storage scope frame for either the 12, or the 13. The narrow bandwidth sweeps must be done really slowly. If you try and rush them,

you will lose most of the amplitude information... the filters just cannot respond quickly. It is a physical reality of narrow band filters.

Nope, the spammer has started up again (presumably the Polish ISP it was posting through has closed the loophole, because it's now coming from China, I think). Fortunately, it's reached the "cancel on sight" spam threshold so most of us don't see it.

It's also an attack on the supposed sender - someone is forging his addresses into the thing.

Ignore it and they'll go away when they stop getting any response.

Chris.

It doesn't appear to be that simple. Google "facsimile copyright law"
and prepare to wade throught a dense maze of passages, all different.
Apparently a unique typographical arrangement of a public domain work,
for example, *can* be copyrighted. But only the layout itself, not
the words. And anyway don't take my word for it, it looks like a
complex topic.

From one Chuck to another,

Thanks for the info and the advice! I will definitely look further into the '13 and '14.

I do understand the need to sweep "slowly" at narrow RBWs. But I'm still troubled by the fact that the *slowest* sweep built into the 7L12 is 10 msec/division! That will, arguendo, degrade the filter response. The storage scope will surely not sweep the SA at a slower rate, and putting a distorted SA output signal into a storage scope can't possibly reshape the response! So there is no cure. If our assumptions are correct, this is a fatal Tek design flaw (not a whole lot of them around).

A storage scope would be really important if the SA is sweeping too slowly for the regular scope's persistence, or to capture a single-sweep trace. Or for simply storing a trace for later viewing. But if the sweep rate is 10 sweeps/second, there shouldn't be much flicker with P31.

Something is amiss here, I think. Maybe there is a typo in Tek's spec sheet? Or more likely, a parity bit error in my cpu!

Chuck

SB-110.

I've been dragging google for a year for QRP, CW, QSK, KIT, and so
on.

About half of the hits are old for-sales. Across the QRP sites,
there are no comparisions of any depth. Most of the kits listed
are no longer available. CW QRP has moved beyond fun building stage
into, well, this:

1) how small can I build the transmitter and in what odd container,
the stranger, the better.

2) how small can I build a full transceiver and with what mininum
parts count.

3) chats about Century 21's, Argonauts, HW-8's, K1's and similar.

4) backpacking operation.

The above and similar are not what I'm looking for.

I'd like a list of the QRP transmitter kits currently available and
a technical "road test" comparison. Several times, I was this
close to just buying the Vectronics and the WA6OTP PTO kit but then
I thought, someone must have tried this. So I go back into research
mode.

My objective is a stable, clean, PTO controlled QSK CW transmitter
to work with a top-end boatanchor receiver like a 75S-1 or SX-100.

1 to 5 watts. One band is OK.

Some semblance of frequency read out.

The radioadventures QSK Keyer kit solves half the problem.

I originally thought of building a transceiver add-on, using the PTO
or LMO derived signal for the transmitter frequency control but
decided that was beyond my ability.

The WA6OTP PTO kit seemed to be an easier and more flexible solution than designing mixers. (I'm a software engineer, as in, lexical analyzers, low level coding, and not a hardware designer.)

Any help is appreciated.

de ah6gi/4 SX-100 with external digital frequency read out.

No, your data sheet is wrong. The slowest automatic sweep is 10 secs per
division. The slowest sweep is manual. This specification exists across
the entire 7L line.

The 7L5, 7L13, 7L14, and 7L18 all have monitors built in that will show
"uncal" if you sweep too fast for the filter setting.

hello all,

before it goes to the auction place, i am offering for sale a Swan 400
with matching 420 vfo. also included is a National power supply.

the rig is in decent shape cosmeticly. the rig does power up but i have
not transmitted with it. receive is low. i have not gone through this rig
and have more projects than i care to deal with. no manual.

price is 150.00 PLUS shipping from 33830. if no one wants it here, i
will split it up and auction it off.

digital pictures upon request.

best 73.

I just looked at the 141t and it takes 2ms/div for no flicker. This is
at wide bandwidth.

At 2khz/div spectrum width and 300 hz bandwidth it takes 50ms/div
sweep speed max. At 5 khz spectrum width it takes .1 sec/div sweep
speed.

At 100hz bandwidth and 2khz/div spectrum width it takes .5sec/div
sweep speed.
Definitely storage scope area!

The 50ms/div sweep can be viewed without storage on a p31 but it is not good.

Thanks for the additional info, Gary.

As you can see, I'm having a difficult time understanding just what the 7L12 does. There may be a typo in the data sheet, but when I look at the time/div dial on the 7L12, it just doesn't have the numbers to do anything slower than 10 ms/div. The other models in the 7L series have many more sweep speeds available, based both on their data sheets and on photos. I suspect that the 7L12 was different. In fact, because the 7L13 has 100 Hz and 30 Hz RBWs, it would have to have slower sweep rates.

Your finding with the 141 was that with a 300 Hz bandwidth and 2 kHz/div width, a sweep rate of 50 ms/div was marginal. I imagine then that a sweep rate of 10 ms/div (assuming that would be compatible with the 300 Hz filter) would be ok with P31. If I understand correctly.

I think we've gone about as far as we can without either having a 7L12 in front of us or at least an op manual. Thanks again.

73,

Chuck

The answer is "copyright infringement." <grin>

Not necessarily of the copyright held by the owner of the call-letters.
but there *is* a copyright on the underlying work. Which the owner of
the call-letters *also* violated, in all probability.

If the person who produced the scans has made their work available 'for free',
they probably only have a civil 'tort' action against the party who is
selling their 'derivative work' (see below) without their permission.

The owner of the 'underlying' copyright, who was presumably 'making money'
from sales of the work, has a basis for a civil suit action, *and* basis for
a criminal complaint.

Of course, the underlying copyright owner also has basis for a civil action
against the derivative work "publisher", as well. :)

>Apparently a unique typographical arrangement of a public domain work,
>for example, *can* be copyrighted. But only the layout itself, not
>the words. And anyway don't take my word for it, it looks like a
>complex topic.

You've got the basics of it right. "complex" doesn't -begin- to cover it.

ALL copyright law is a _deep_ swamp. <wry grin>

Two sections of it are notably deeper, and populated with more, meaner,
alligators, than the other parts. One is "fair use" exemptions, the
other is "derivative works".

"derivative works" are works, involving some original/creative effort, but
'based on' the creative work of another.

The person who creates the 'derivative work' owns the copyright on
their "creative effort" part of the final work, and that part *only*.

To reproduce that derivative work, you must have the consent/permission
of *BOTH* the creator of the derivative work, _and_ that of the owner of
the original, or 'underlying' work. Postulating that both copyrights are
still in effect. If the 'underlying' work _is_ in the public domain,
the derivative work copyright is _still_ valid.

A 'raw' scanned image of a page (or a series of scans of a booklet) does
not satisfy the 'creative' requirement for a derivative work.

A scanned image that has been 'cleaned up' -- rotated to square, de-speckled,
contrast-enhanced, etc. -- based on the esthetic judgement of a person,
does have creative effort involved, and 'derivative work' protection
applies.

That's not what this says:

http://www.tucker.com/images/images_spec/00000453.pdf

I wouldn't assume that the resolution BW of the 7L12 would be adequate
to look at IMD down 40+ dB at 1 KHz spacing. The BW is specified as
300 Hz at -6dB with a -6 to -60 dB shape factor of 4:1. I don't have
time to plot the selectivity curve at the moment, but it might be an
exercise for you.

If you have a "perfect" cw signal as input, when you sweep it, what
you are plotting on the screen is the filter response of the SA.

Figure a Gaussian response with the specified shape factor and then overlap two of the curves with 1 KHz spacing and see if the filter skirts are down 50 dB where they overlap. (You should have 10 dB of margin IMHO)

Personally I'd use the HP with a storage mainframe.

I pulled out a 1981 Tek catalog, and I am indeed remembering wrong.
This is yet another reason why I discounted the 7L12 as a credible SA.

Here is what Tek is expecting you to do. There are timebase positions
for 5ms through 0.01us. These are for use when the SA is being used as
a receiver (time domain mode), and you are looking at a received pulse
train.

The "SA" mode is *variable* from 10ms through 5ms/division. You are expected
to manually adjust the sweep rate to get a clear picture.

So, how can you get 300Hz filter resolution? Well, simply by not scanning
the full bandwidth of the SA plugin. Reduce the sweept bandwidth to 10KHz,
and 300Hz is easily achieved with a 5-10ms/division sweep rate. Not a great
way to go, but usually if you are interested in the narrow resolutions, you
are only looking for signals over a narrow bandwidth.

As I said earlier, get a 7L13, or 7L14. The 7L12 wasn't fully incubated
when it was hatched.

When you go looking at the 141T, remember, it is a mid 1960's SA design,
and it feels like it when you use it. The 7L5, 7L13, and up were designed in the
very late 1970s, and take advantage of things like microprocessors to help
with house keeping operations. They are smaller, quite reliable, and just
plain work better than the 141T family. (And, yes I have owned, used and
repaired both.) The 141T storage tube is a nightmare. Very short life.

Another SA line that is usually very inexpensive, and much better than the 141T
family, is the Eaton/Ailtech 727 and up. I was told (in the early '80s) by an
HP FAE (who specialized in HP's SA's and other RF gear) that the Ailtechs were all
over the place in HP's internal R&D labs. They were the SA's that HP used in
designing their own product line.

(flame suit on, helmet latched, as I await the onslot of rebuttles from HP guys..)

No, I agree - while ok for "routine work" the 141 is *old*. OTHO - if I were to suggest a Tek 7603 solution - I'd say see if you can possibly squeak into a 7L18. I know - an absolute budget buster - but it can "look" at just about anything in the "usual" spectrum - and do it with fair accuracy. Had the pleasure of using them - never could afford one myself - but perhaps some day. Oh - and a word of caution - if you're going to some 7000 series solution like this - don't make the mistake of buying an USM-281C - they'll tell you it's a 7603 - and indeed they are - what they DON'T tell you is that they are a 7603 Option something or other - which means they DON'T have the on screen readout... Which makes a 7L - and similar stuff useless in them.

best regards...

I too, like the 7L18. I have the 7L5, 7L13, and 7L18 on my bench. The
7L18 is not a general purpose SA, as its range is 1.5GHz to 60GHz. It
doesn't go down to DC in its capabilities.

The 7L5 is DC to 5GHz, with digital storage.
The 7L13 is DC to 1.8GHz no storage.
The 7L14 is DC to 2.5GHz(?), with digital storage.
The 7L18 is 1.5GHz to 18GHz, 60GHz w/external mixers, with digital storage.

The 7L14 is the holy grail of the series, as it has the digital storage
and a slightly improved bandwidth.

They all make extensive use of the "labeling" feature of the 7000 series
scopes, so it is important to avoid the "N" option on your mainframe.

Well, you can always just use an hf receiver with a stepped attenuator
and a narrow CW filter, but it's not so handy.

Hey, if you started using SA's in the 60's it's perfectly natural. [g]
We had one (don't remember the no.) that predated the 141's. Two
boxes that took up about three feet of rack space. Drifted like crazy
and used harmonic mixing so you didn't know what the hell you were

looking at.

The 7L5, 7L13, and up were designed in the
>very late 1970s, and take advantage of things like microprocessors to help

Not when used properly, which most weren't. The ones in my lab worked
flawlessly until we upgraded. I auditioned a TEK 492P when they were
first issued. Never liked it even tho I had a capital acquistion
approval for it I didn't buy it. Bought an HP8566 instead. Of course
there was no comparison size and weight wise, but the HP was
rack-mounted and wasn't going anywhere. Programming was *much*
friendlier.

My only Ailtech experience was with their NF boxes and that goes back
to when we were using gas tubes in waveguide [g].
>
>(flame suit on, helmet latched, as I await the onslot of rebuttles from HP guys..)

No offense to Roy Lewallen and Wes Hayward, but at Hughes it was an
unwritten rule, you want a 'scope, buy Tek; you want a network or
spectrum analyzer, buy HP. You want a DMM, "If it works, it's a
Fluke." I did buy a Wiltron scalar network analyzer once for a
dedicated test position.

If I was to have a SA at home just for hf work I would love an HP3585.

And until the N2PK network analyzer came along, I lusted for an
HP3577.

Hmm. Quite right - I must be thinking about the 7L14 - as we weren't doing anything that high - but at the time - whatever it was- was the top of the line and brand new - as the Tek techrep hand carried it to us. Like I said - got to use one - didn't get to keep it.

best regards..

I remember using one of those. It had the 140S display unit, a point contact diode in the unbalanced mixer. The diode was under a cap on the front panel, so you could tap it to improve its sensitivity, or replace it. Hot stuff once. Hard to believe that anyone could get useful work out of one. I had an Ailtech 707 in the same lab, you can guess which one got used.

The Ailtech was nice because other than the logging amplifiers, and the display, there was nothing custom in the unit. It was a collection of microwave modules, dbm's, yig vco's, ... all tied together with 141 semirigid hardline.

Bob -

What is "special" about this switch (e.g. hole size, color, neon light).
RigPix had a poor photo of this amplifier
http://www.rigpix.com/linears/hl2200.htm
but it looks like a standard switch that Carling produced.

If you "pulled" the switch does it have any mfg. numbers for cross
reference?

w9gb

Really nothing special, it just would match the other two. Heath part #
61-45.

Haven't pulled it yet to look for markings..

Bob

OK
Arrow Hart Wiring Devices, Syracuse, NY, USA, 800-628-8956
E-mail: crouse.customerctr@crouse-hinds.com

I have seen references that Arrow Hart is new part of Cooper Industries -
Cooper Wiring Device Division - Arrow Hart (Cooper Crouse Hinds).

Arrow Hart commercial and industrial switches
003/51094/00 SWITCH,DPDT,ARROW HART 260211E $ 13.33

Page D-19 of the catalog
http://www.cooperwiringdevices.com/catalog/PDF/D_CWD_Switches.pdf

Looks like either surplus OR a cross match to competitor switch with same
specs (not uncommon in the appliance switch market)

Wow. Thanks Dave!

I'll have to find someone with a faster connection than my 28K dial-up
to fetch it for me, but great job.

Dave:

Excellent contribution...

I am interested, did you use fine reader for scanning or another? And, did you use adobe to create the .pdf or other free software? Is the .pdf text searchable (in text format) or not (in graphic format?)

Warmest regards,
John

The work was done using only noncommercial (freely-distributable)
software tools... the SANE scanning software, NETPBM image-processing
programs, The GIMP for manual image processing, and GPL GhostScript to
create the PDFs. I wrote a bunch of custom scripts to perform some
higher-level functions (e.g. automatically levelling, centering, and
"bleaching" the pages).

The text is not searchable. I don't have access to OCR software which
can do the job with acceptable accuracy, nor the time required to
proofread the whole book and correct the inevitable errors. The PDF
text is all in graphic format.

Did I say anything about an attachment? 28K is fast enough for a
personal note.

The original scans are 300 dpi grayscale, PGM (portable graymap)
format. Easily translated to TIFF.

The data in the PDF itself is 300 dpi one-bit-deep black&white data,
compressed... converted from the grayscale data via thresholding.

Well, will have to play with this awhile... never attempted to use
finereader with existing scans... and not having much luck working something
out--I expected it to be more straight-forward...

Warmest regards,
John

Not familiar with it, don't really care to be. I have a policy of
avoiding the use of Microsoft software on my systems except when no
decent alternative exists.

> I am not sure if there is a counterpart in the Linux
>world...

Adobe Acrobat Reader has a "continuous, facing" display option - pairs
of pages side by side - which I suspect is close to the "paperback
style" to which you refer. Works fine with the PDFs I'm distributing.

> are you dual boot?

No, I don't trust that mode, for a couple of reasons. Some M$
operating systems are known to rather aggressively overwrite or
destroy other OS's partitions or boot blocks, sometimes without asking
or warning. And, given all of the security exploits against Windows
and Explorer and etc. floating around, I feel safer not allowing
Windows to have direct access to my hardware.

I do occasionally run Windows (usually Win98) in a VmWare virtual
machine, with a virtualized hard drive, for things like tax software,
ham-radio programming utilities, etc.. That way, it's running safely
in user mode, can't get to the real hardware, and I can wipe it and
start over from a checkpoint save without affecting the rest of my
system.

Getting it down to 1 meg would necessarily sacrifice almost all of the
detail in the photographs - they'd be unviewable. 1 meg might be
enough space for the text, and possibly for the black&white charts and
line drawings (as bitmaps) but the photos would be lost.

"For Pete's sake" is an interesting American exclamation. How did it
arise?

Did it arise in the 1930's? Any connection with the villain Pegleg
Pete who appeared in Mickey Mouse cartoons of that era?

Reg.

The pics would be converted to .jpeg... the text, in an efficient ebook format, would be held compressed--very small... I did say one-meg+, I was thinking about the pics (graphics) when I included the '+'... black and white compresses very small, gray scale not as well... still, 33 megs is HUGE! I don't see it being any larger then 3 megs at worst case... 1/10 is good...

Warmest regards,
John

Ahhhh, a "Linux Warrior" serving in the Linux Army seeking world conquest...

Probably about 90%+ (at the very least 80%) of all computer users are windows based... I simply think of the biggest audience (greatest good-greatest number, America used to be like that--I miss it...)

I go between Linux and Windows as necessary, my recreation machine is Slackware based (mp3s, movies, personal coding, etc...) ... Mac I avoid (but, they can run Linux)... those guys (Mac'ers) are worse then Bill when it comes to proprietary rights and control...

.pdf is great, but huge...

I thought you were more interested in the free sharing of info than fighting operating system wars... nothing wrong with either... both serve a purpose--but best done one at a time...

Warmest regards,
John

| Getting it down to 1 meg would necessarily sacrifice almost all of the
| detail in the photographs - they'd be unviewable. 1 meg might be
| enough space for the text, and possibly for the black&white charts and
| line drawings (as bitmaps) but the photos would be lost.

The reason it's 33 MB and not 1 MB is because the .pdf file is basically a bunch of pictures, one of each page. That's also why it's not searchable, and why you can't cut and paste text out of it.

33 MB is on the small side for books scanned like this.

In comparison, the Bible is only 1.34 MB in size in text format after being compressed (http://www.gutenberg.org/etext/10) -- and it's a big book. Even War and Peace is only 1.16 MB (http://www.gutenberg.org/etext/2600).

In order to get it under 1 MB, you'd generally have to use some sort of OCR software to convert the picture of text into text. I presume there would also be some pictures, and they'd have to be stored as pictures, of course.

Unfortunately, good OCR software is hard to find, and I know of no software that could take a book, scan it, convert it to text and images as appropriate, and do it accurately enough that a human wouldn't need to proofread the entire document carefully. And that is a very large job.

The reason it's available with BitTorrent is because that allows lots of people to download it relatively quickly without totally sucking up his bandwidth. It may be a bit more work to download than something that's just a link on a web page, but it works nicely once set up.

In any event, scanning and distributing out of copyright books like this is a worthy endeavor. Thank you!

Looks like there's a few other radio related works on Project
Gutenberg. Go to `http://www.gutenberg.org/catalog/world/search' and
search for `radio' for a list. None seem to cover antennas
specifically, but ` The Radio Amateur's Hand Book' looks interesting.

Fine Reader has no equal, still must be proof read, but I am always surprised how accurate it is, when pages have been scanned at high enough pixels... 200 is good, 300+ is excellent... it is smart and knows pictures when it sees them... all this is easy to suck into word and put a book together rather quickly... microsoft provides a FREE (what was Bill thinking!) plugin for Microsoft Word which will construct a .lit ebook from any word doc and presto... you have a ebook of excellent format--and even with pics--small...

The guys on the #ebooks chan on the undernet servers of IRC used to provide such books and info on how to create them--it is where I picked it up at... they create books in all formats... but for quality and size, .lit is what appeared best to me... microsoft provides a FREE (what was Bill thinking?--again!) reader to read them, called "Microsoft Reader."

Warmest regards,
John

Hi Doug,

Also from Gutenberg (along with several dozen other titles) is my copy
of Casanova's Memoires (which fits in my Palm Tungsten E as an ebook).
It runs to 3.9 MB (about two feet of bookshelf space). No pictures by
the way.

You might consider being a bit less quick to toss off those
stereotypes, John. They can blind you more than they illuminate.

>Probably about 90%+ (at the very least 80%) of all computer users are
>windows based... I simply think of the biggest audience (greatest
>good-greatest number, America used to be like that--I miss it...)

... and all of those Windows users can, if they choose, view PDF
documents. "Portable", y'know? The Adobe software is free, and works
fine.

What I'm not particularly interested in doing, is creating a
non-portable (Windows-specific) version. Why restrict the usability?

If you want to do so, go right ahead... as long as you comply with the
simple "noncommercial, share and share alike" copyright terms on the
PDF, you can create a further derivative work to suit yourself.

I'll be curious how many tens, or hundreds of hours of work it takes
to develop a suitably-high-quality textual representation of this
book. Do let us know!

>I go between Linux and Windows as necessary, my recreation machine is
>Slackware based (mp3s, movies, personal coding, etc...) ... Mac I avoid
>(but, they can run Linux)... those guys (Mac'ers) are worse then Bill when
>it comes to proprietary rights and control...

And that's pretty much why I stopped using (and developing software)
for my Mac, put it into retirement, and switched to Linux. (Could
have been a *BSD derivative, but there was a big two- or three-way war
going on within the *BSD camp at the time).

>.pdf is great, but huge...

By today's standards?

>I thought you were more interested in the free sharing of info than fighting
>operating system wars...

I am. You raised the subject, and I simply answered the question to
explain why I'm not personally interested in doing what you want.

I've done what I set out to do - get this work back into public
availability, in a useful form. If that form does not suit your
desires, that's your issue, not mine, and you're free to correct the
situation.

Dave, I said an excellent contribution on your part--few will do as much, here I just repeat what I have already said...

Nothing wrong with .pdf, except it is too large... and in the case of all graphic content--not text searchable... .lit just gets things a bit more right, the format is easier to read, and it provides "text to speech", it will read the book in audio for you--even the visually handicapped can "read" it... and it is all free to make and read... (well, you have to have MS Word access)

I have access to a scanner which, if the back rib is cut off a book, and pages freed, scan a whole thick book in minutes--I have hand scanned books on my home scanner, a high speed scsi HP, and it does take a bit of time and effort--I am sure you did the same with the book you are speaking of, and know well that task... on a fast computer, conversion of a page by fine reader is seconds... it really just depends on how good the scanned images are... much less than 5 secs a page for good quality--scanned images...

I was hoping the "bookworms" on Linux would have come up with a compatible reader for Linux for .lit--I haven't searched--but is an excellent format to just ignore for petty battles--however, MSs' rights on it may make this impossible...

However, there are other routes to take too, one is .html, all platforms can read it and there are ebook creation tools which create to this format (pics can still be .jpeg's)--and can be read with any browser, ms word, the freeware star office for linux, html editors, etc...

We live in the land of computers--no task is impossible--many roads all lead to the same destination(s)... a good broad picture of what is available is good to have... I am sure I have not been able to find all which is available... still got the eyes open...

The ONLY "fault" I was finding is the size... download time... storage on disk (forget floppies, fill up a zip disk, cdrom quick with books that size, etc)...

I did not intend for you to see my comments as a "slur", rather I respect your work and your contribution... and like I said on my first post here, THANKS!!!

I think "Linux Warrior" is accurate... even your post I respond to here seems to mention and reinforce your commitment to Linux... no big deal... the corp. I work for does work in both Windows/Linux, I don't have an option to ignore one or the other, I have no real problems with Windows XP, Microsoft finally started doing something right... I came from the

commandline prompt in UNIX, then to DOS... was shocked when Linux went
GUI... but got used to it quickly...

Nothing wrong with Linux Warriors... one of my best friends is a general in
the army...<grin> I just think of myself as living in a "neutral country"
(like Sweden) when it comes to religious and political commitments to an
OS...

Warmest regards,
John

So when are you going to stop talking and do it? Otherwise take what's available and stop whining and putting down other people choices (i.e. SHUT UP). 99% of us couldn't care less what your opinions are- as in "sharing them" - you've managed to insult and alienate many people here in a very short period of time. If that wasn't your intention - then I suggest you review your words and consider them from other's perspective. If it was your intention (as your overly broad slam against Mac users, seems to indicate -- and no , I'm NOT a Mac user)- then [plonk].

Not warmest regards - in fact with growing disdain...

I've got reasonable bandwidth resources, so I've put up the 'printer'
version as a straight PDF download, for those who don't have bittorrent
available. <http://www.r-bonomi.com/radio/>

The server does impose limits on transfers --
it rate-limits that file to 16kbyte/second,
so the download will take almost an hour.
it will also allow no more than 4 simultaneous downloads.
It gives a polite error, if the session limit is reached

Enjoy!

Well, gee, I was so enjoying the fact you were out there reading my posts, what a disappointment now that you have went and dropped me in the old bit bucket...

And, gee, I did come here just to sit around and idolize everyone... guess my coarse nature prevents that--oh well, we all have to work with some kind of handicap--guess we will all survive...

Thanks for pointing out your opinion(s)--I will surely keep it/them in the back of my mind... perhaps at some future date it/they will be useful, no knowledge is without merit...

Don't attribute more to me than I am capable of though, can't really take the credit for "alienating" anyone--they all have free wills and do as they please--really, I don't have that much control over people--it is really their strengths and weaknesses which limit or raise them to the heights they find themselves standing at... thanks for being so flattering though... unless you meant I should suffer others "control freak" natures--then I must decline...

Since I have been in the exchange of text, here is this thread-all I have gotten is a list of won't work, shouldn't work, isn't supposed to work and might be illegal or offensive to "radio gods"-I don't work that way-indeed, if the purpose of this is to stop anything-it has exactly the opposite effect. I can tell from the lack of young and dynamic minds here that you have been successful, either by intention or not, at quelling all but conversations revolving around tried and true ideas and in the discussion and worship of ancient texts-which are obscure and difficult to obtain and hinder learning by those very facts. interesting way to "run a ship" but not very conductive to getting anything done. I think most tire of this and move on-leaving a bunch of grouchy old farts that wish to get back to worshiping some ancient ham/author that wrote a book/article a few decades ago. and not be bothered with having to think. not surprising that amateur radio reflects what is done/said here... and suffers for it.

While this may please some-it does not please me-one must ignore this all and move on. if you or any others need "ego stroking" perhaps there is already such a newsgroup thread, or, one could be created. I am almost positive you will find what you want there-certainly, if not, you will be left alone there--most likely with others of your ilk--perhaps this will generate a need to start up a mutual admiration society, and another newsgroup thread will spring to life.

Warmest regards,
John

Many thanks for doing that, Robert! If your server keeps stats, could you let me know how many downloads it sees over the next few weeks? I admit to being curious.

FWIW, the BitTorrent tracker reports a total of 60 completed downloads so far - 21 of the smaller ebook version and 39 of the printer-optimized version. I find that to be a very satisfying response, for a day and a half of distribution of an admittedly obscure text... I'm glad so many people were interested.

I'll be leaving the BitTorrent tracker and seeders running for the forseeable future. HTTP access is certainly more convenient for most folks, and for handling sporadic occasional downloading. I may shift my home system over to doing both sorts of distribution at some point in the future, when I'm fairly sure that the rush is over.

Of *course* it keeps stats. What fun would it be otherwise? <grin>

In the 2-1/2 hours since I posted the notice, I've had 7 full downloads,
and a couple of aborted ones.

And one guy _did_ get turned away for a bit, because there were already
4 downloads running. :)

Drop me an email to remind me, when you want to see the numbers.

Note: I've got a psychic mail-server. The address on the postings _is_
valid, but it accepts mail *only* from inside a newsreader, in reply
to an article I posted. Amazingly effective at eliminating 'spam'. :)
The reject notice does provide a work-around, for those who need it, too.

Dear all,
I know the quality of this BA.
Last Sunday I was walking five hours along a flea market,
found a Hammarlund 600 and was playing with the mechanic.
It seems it was OK, but unrestored.
The asked price was 180 Euro, but I have limited space :-(
Do you think I should bite my ass?
Kind Regards,
Georg

Odd, and interesting! I had a similar report from someone else last night.

On the other hand, I just went to the link myself, fetched the torrent file, and my BitTorrent reference client launched itself and started a download of the -ebook version with no problems at all.

What client are you using? Are you behind some sort of NAT gateway or other firewall?

The tracker shows me three downloads in progress - my own (of the -ebook) and two others (of the -printer). I'm getting about half of the download bandwidth, though, so it may be that one of the transfers is stalled for some reason.

The documentation at BitTorrent.com points out that downloads may not work, or may be quite slow, if you're behind a NAT and don't arrange for port forwarding of inbound connections from your peers. In this situation, you can end up being unable to exchange data with some or all of the peer sites you try to connect with.

As I understand it, this shouldn't affect the seeder I'm running, since it already has a complete copy of the file and doesn't insist on a tit-for-tat exchange of data. However, it's possible that there may still be some issues, with some NATs or firewalls.

Both my tracker, and my seeder clients, use the BitTorrent 4.01 reference implementation, and neither is behind a NAT. I've been able to transfer successfully from a system here at work which *is* behind a NAT, and the transfer went quite efficiently. So, it's possible that the problem lies at your end, although that's not a certainty.

My system _does_ react rather strongly, in defense, against systems which appear to be trying to port-scan it for vulnerabilities or trojans... it'll slap down a hard IP filter against such systems and will appear to "vanish" from the net.

Thanks for the response. I don't think I have a problem with the
network side, since I forward the torrent port to that box, and my ACL
allows that port to see all public addresses. I have a Cisco IOS DSL
router running the latest release, so I have a bit more flexibility than
most. I'll give it another shot tonight.

OK, good luck - please let me know how it goes.

You might want to check to make sure that you forward both the torrent
management port, and the full range of torrent-client ports. Since
I'm running two seeders, they're on two different ports on my system
and might be trying to talk to different ports in your client's range.

No go, and I added extra ports - 6882-6889.

Your end is trying to connect on nonstandard ports back to my end. They
are not ports listed on any of the torrent pages I've looked at,
assuming your end is 195.23.xxx.xxx. It tried from 6882 on your end to
2471, 2523, and 2546 on my end. 6882 is fine, but as a destination.

Nope, that's somebody else - the IP range looks like it's in Portugal.
It _could_ be someone else who is fetching the torrent and is trying
to peer with you (there's one active downloader for each of the two,
at the moment), or it could be J. Random Nastyguy portscanning your
system looking for trojans and etc.

I'm really not sure why you're having the problem. I do see that the
4.01 BitTorrent tracker has some logic which tries to figure out
whether the system asking for the download is behind a NAT, although
I'm not sure what it does with the information. I'll try restarting
the tracker and turning that feature off... maybe it'll make a
difference.

Hi David,

Here is a reply to a similar request about Dayton.

73 Larry WA9VRH

Well I think the shock of a dry Dayton is having a
large effect on everyone!
If I wasn't there I would have never believed it!

There were lots of BA equipment there this year.
There was an estate from a 4 land person that
supposedly his wife was
dealing with (who was also a ham) (if anyone knows
more details please post)
This guy had a ton of stuff mostly Collins but
everything from SP600 to a
Harvey Wells TBS-50D. Prices were pretty much in line
with averages on most
of the equipment with the Collins being maybe a little
high.

I saw a number of SP600's from oh I think it was
$150.00 ea for a couple to
more regular going prices. Lots of Drake TR-4 series
and TR-7 series.
An NCX-3, NCX-5, and couple of NCL-2000's. Two
HRO-500's one working the
other the synthiser (sp) would not lock up for I think
it was $450.00 to
$500.00. Also the LF device for $500.00.

Lots of Hallicrafters stuff in all kinds of shape.
Even a MutliElmac or two
was spotted. There was also an Eico 753 transceiver
but no 720's or 730's
that I saw. There were a couple of Hallicrafters
HT-40's and SX-140's and
an Echophone or two. There was a lack of RME
equipment. (something I am
interested in since I have lived in the Peoria Il area
for a long time)

There were also a few Gonset G-76's WITH AC power
supplies. Also the 2m and
6m versions of the Gonsets. Missing where the G-66 and

G-77's along with the
Gonset Sidewinders.

Also a few pieces of Swan equipment but not many.

Well that's it from my memory. Probably would be able
to think of more but I
am sure others saw more.

Dayton as always will be Dayton. They announced once
again they are NOT
moving and I for one believe it to be true for at
least a couple of years.
There is no doubt that Dayton is the place to find it.

Some of the prizes I brought home were a G-76 and G-76
AC power supply, a
broadcast station console, a bunch of parts, a pretty
much empty cooler,
(insert the stuff of your choice inside) and a Great
Time!

J Random Nastyguy gets caught and reported on my net. Like the .kr I
nailed tonight trying to ssh2 in. It would be easier to just block the
whole of the far east, and I may do that someday soon.

Well no matter, I'll live without it. Sounded good though.

It's sure tempting. I've already got fairly hard email blocks against
most of the far east. For a couple of my domains, I've even
programmed by DNS servers not to respond to queries from those
areas... just too darned much spam.

>Well no matter, I'll live without it. Sounded good though.

I've turned off the NAT-check filter, and noticed that the number of
downloaders jumped up suddenly from 2 to 4. You might want to give it
another try and see if it works this time. My tracker may have
"noticed" that you were behind a NAT, and decided to snub you...
that won't happen now.

Another thing to check, is to see what happens to *outbound*
connections from your system, to port 6881 on other peoples' systems.
I can see that my own downloader (which has a complete copy) initiated
an outbound connection from its port 2723 to someone else's 6881. It's
conceivable that your downloader tried to "connect out" to someone
else's 6881, did so from a dynamically-assigned port number, and that
your firewall rules are blocking the SYN/ACK connection responses back
from the other downloader's 6881.

If that still won't work, then you might want to check at
http://www.r-bonomi.com/radio/ - you can probably get a copy via HTTP
from there.

No joy on torrent from your site, and I have test downloaded from
several other places with no problems at all. Wonder what the heck the
deal is.

Forgive us, we have watched too much TV and are easily distracted by an unfamiliar colloquialism. I picked up a SP-600 for $300 at a hamfest 3 yrs ago and it's a great radio. In a limited, station by station comparison to a Drake R-8 which I aquired this very afternoon, the SP-600 on a 45' t2fd seemed slightly more sensitive and had slightly more pleasant audio than the Drake on a 110' wire fed through a ICE matching transformer. Nothing scientific, but pretty good for a 53yr.old receiver. Having said that, until the last 2 or 3 yrs. of manufacture the SP-600s were made with a failure prone type of capacitor sometimes known as the "black beauties of death." So unless, upon removing the bottom cover, you see a mess of ceramic disc capacitors, there will be a fair bit ofwork involved. I lucked out and a previous owner had performed that labor of love on mine. There are a lot of resources of the web for this radio, (hats off and many thanks to Les Locklear and James Moorer,) and even a video available to help you through the thorny patches, should you decide to take that bite. Good luck, Steve Maus

From National, Collins, and Hammarlund? Or would the big
three be Swan, Heathkit and Ameco?

After all, this is the boatanchor newsgroup.

Oh, silly me, didn't include how to use the information on those proxies...
here is how microsoft suggests doing it, for internet explorer...
http://support.microsoft.com/?kbid=135982
Don't forget to turn off the proxy (remove the proxy setting) if you lose
internet connection... these proxies disappear if the computer you are
preying through shutsdown or turns off proxy sharing... if so, just grab a
new proxy address and port off that page, in the previous post, and plug it
in and off ya go...

Warmest regards,
John

Beats me! This is really strange. There have been a total of 80
successful downloads so far.

Protocol-revision problems? Moon in the wrong phase? I just don't
get it.

So far, I haven't figured out the magic incantation to get the tracker
to tell me who it thinks is connected, and what they're doing. I'll
keep poking at it when I have the opportunity.

I am in need of a meter for a Warrior amp. The one on my amp is very "sticky". Any ideas on fixing this one will be appreciated also. I have tried to adjust the jewel bearing, but no luck so far.

Remove "nospam" to reply.

Thanks,

Mark

Did you check between the magnet polepieces and the moving coil?
I found one with a sliver of steel wool that made the meter stick.

> you through the thorny patches, should you decide to take that bite.

Thank you very much for your very interesring explanations,
an excellent example!

There are two souls living my chest:
The one is hooked for boatanchors of any shape like turntables,
open-reel taperecorders, measuring devices,

console radios with turntables, gramophones and receivers like the 600 :-)
The other one is beating my fingers because of limited space :-(

The other one let me go away without the Hammarlund.
The one is dropping tears, because I have no BA for shortwave.

I assume you can imagine why I had posted my frustration.

But I should be happy with my two Telefunken receiver boatanchors,
one PE476 direction finder, and the E149, both identical in construction.
Fortunately yesterday I received the service manual from an ebay auction.

Regarding the "black beauties of death", the Wima "Tropydur" capacitors
was the German counterpiece: looking like crispy dark chocolate and always dead.

Fortunately most of the German professional receivers was mainly equiped with
metal paper capacitors, self-repairing in case of mild overvoltage and living
until eternity if not overstressed.

Thank you very much again!

Kind Regards,
Georg

If someone lawfully downloads something on the internet that is not protected and sells it, and another person calls him a thief, or infringes upon his right to sell that item, then the person who is harmed is the seller - who in turn has a cause of action against the accuser for libel and interference with the right to sell.

Be careful when accusing someone of being a thief, or they may take your money from you.

If you're going to have that attitude, why bother to upload it in the first place? I keep the paperwork for the radios I restore. Some day my collection will be sold off after I'm gone. How would it look for the paperwork to be littered with "Stolen from" all over it? I'm sure others do the same thing.

Oh come off it Colin. We all know that none of us has the real rights
to this material. What I'm saying is that if "I" go to the trouble to
scan in a 200 page manual and then upload for free use by others, I
have done most of the work and if someone downloads this work and sells
it they are stealing my work. In that regard the seller is a thief.
Maybe not in the legal sense but in a moral sense he is. THIEF he is
and THIEF I'll call him.

What about the professional repair guy who downloads a copy of the manual
you scanned, and then **shudder** asks top dollar to repair a piece of
equipment using that manual? That manual has enabled him to make the repair,
and he has, in essence sold that manual to his customer. I bet he has made
more off of the free manual from BAMA than any of the ebay merchants.

(OBTW, I have been that guy.)

If you have conditions on how the manual you scanned is to be used, don't make
the manual publically available on BAMA. Go off and sell it yourself!

-Chuck

That's a little harsh. I've tried to download stuff off BAMA.
Success varies. If someone with more patience than I manages the
download, perhaps doing it at the wee hours, there is value in that.

Granted it seems unfair but I don't have to pay them, I can stay up
and try for an "opening".

Where there is an ethical problem (as in, ethics among intellectual
property thieves), is that the sellers on eBay aren't saying, "I got
this off the public Ham Radio manual site and burned it to CD for
you. Please bid appropriately."

and

"Those of you who don't have broadband or perhaps want the
convenience of CD's will appreciate this service."

I'm not saying that it's wrong to propagate manuals for 30 year old
radios. I recognize that it is outside the law but you lawyers out
there, libraries have copy machines in them, even the Library of

Congress.

Clearly the law is wrong about intellectual property rights in this area.

In article <1117186785.327090.76340@g14g2000cwa.googlegroups.com>,
;-p <no_spam_here34474@yahoo.com> wrote:

| Oh come off it Colin. We all know that none of us has the real rights
| to this material. What I'm saying is that if "I" go to the trouble to
| scan in a 200 page manual and then upload for free use by others, I
| have done most of the work

Actually, the authors of the manual have done most of the work, NOT
YOU. Don't get me wrong ... I find resources like yours to be
extremely useful, and I'm glad you do it. And let me say `thanks for
doing it', because while I don't think I've used any manuals from your
site yet, I've used manuals from other similar sites, and I'm glad
they were there, and may use your site at some point in the future ...

But to claim that somebody else is stealing your work is a bit odd,
because unless the manual is really old, you are legally stealing it
from the authors.

In the US, if a manual was written after 1964, the odds are that it's
still covered by copyright (the only way it wouldn't be is if it was
explicitly entered into the public domain.). If it's written from
1923 to 63, it'll still be covered if the copyright was renewed. Few
are, but it's possible.

Granted, the manufacturer may be out of business. Or they may not
sell the manual anymore (as is very often the case.) And they may not
mind if you scan it and put it online -- it helps out their customers,
after all. But even if the manufacturer is out of business and you
can't even find who owns a given copyright, that doesn't mean that
nobody owns it, and it doesn't mean that you can legally scan it and
give it away as your own. Odds are that nobody will mind, but it may
bite you at some time in the future.

| and if someone downloads this work and sells it they are stealing my
| work. In that regard the seller is a thief. Maybe not in the legal
| sense but in a moral sense he is. THIEF he is and THIEF I'll call
| him.

He's no more a thief than you are, if the manual is still covered by
copyright. In that case, both him and you are `stealing' from the
owner of the copyright. Odds are that the owner doesn't mind, but
unless you have written permission, it may bite you at some point in
the future.

As was suggested, if you want to claim copyright on your scans, either
do more than just scan them -- clean them up, add searchable indexes,

OCR them and correct the results, etc., or do what I suggested -- add
a little poem at the end about ham radio or something. Either one
could give you some claim of copyright on the final result and could
give you legal recourse against whomever is violating _that_
copyright. (Of course, I'm no lawyer. You may want to talk to a
lawyer about it ...)

Or you can just scream until you're blue in the face about the THIEVES
STEALING YOUR WORK! It won't change anything, but maybe it'll make
you feel better.

2350. Quiet fan for my radio rack

Newsgroup: rec.radio.amateur.boatanchors
Date: 2005-05-28 11:45:37 UTC
From: shoppa@trailing-edge.com
Message-ID: <1117280737.210395.281170@g47g2000cwa.googlegroups.com>

I'm the new proud owner of a R-390A. (Some will say I'm a fool but
I had to follow my heart!) It's rackmount, which is great because
I've got rack space. I want to keep it well fed and ventilated.

At the moment, the rack has a 10" EG&G/Caravel Rotron fan in the top.
It moves a lot of air and generates a fair amount of noise. Not
bad in a computer room, but I want to hear the radio instead of the
fan.

I anticipate keeping the R-390A on more regularly than my other tube
radios (Heathkits etc.). Probably several hours a day.

In addition, the radio probably isn't as thermally stable as it could
be if
I'm sucking lotsa air through it. Someone might tell me that it's
bad to use a fan for some other reason.

Which way to go? Speed control on the fan to slow it down and keep
it quiet? No fan at all, because the R-390A was designed not to need
it? Some vastly more quiet and appropriate fan?

If you elect to stay with fans, I had good luck with fans from
acoustiProducts. (vendor http://www.siliconacoustics.com). I used these
for an OR application, trying to surgeons happy. They really were quieter
that :Standard" fans.

Hear a few of the other manufacturers of reduced noise fans. IMHO, you
really need to look carefully as the word quiet is very subjective.

Specifications for Panaflo and for Cormair Rotron Whispers are from
www.comairrotron.com

Specifications for NMB fans are from www.nmbtech.com

Specifications for JMC fans are from www.jmcproducts.com (good ANSI specs)

Noiseblocker fan specs from www.Blacknoise.de, but good luck finding the
fans in North America.

Verax fan specs from shop.erfrier.net (German). I'm not sure if they are
available in North America

My experience is that ordinary fans run at reduced voltage are a great way to achieve quiet operation. The muffin fans in HP 264x CRT terminals ran virtually silent because HP operated them at 1/2 their nameplate voltage. I cool my old Heathkit boatanchor rig with a 12 V brushless DC muffin fan that is silent because I run it at 6 V. If your rack has 2 fans an easy solution is to simply wire them in series so they run at 1/2 voltage.

I'll agree with those some others. I used the mil equivalent of the
R-390 when I was in the army in the late '60s in Germany, and I was
stuck in a radio van on the back of a deuce-and-a-half. One consolation
was that it didn't need much heating in the winter. I think the one I
used was made by Motorola (or were they called Galvin?).

> At the moment, the rack has a 10" EG&G/Caravel Rotron fan in the top.

The radio site was right next to the 100kW diesel generators that ran
24/7, just to run all those toobs and air conditioning they needed to
cool them. Nothing like a diesel generator to keep you awake all the
time. The guy that bunked in my cubicle used to bring his (Dave Clark)
earmuffs to bed with him, and sleep with them on. I never could figure
out how he did that. ;-)

> In addition, the radio probably isn't as thermally stable as it could

Use a filter to keep out the dust and reduce the noise.

> Which way to go? Speed control on the fan to slow it down and keep
> it quiet? No fan at all, because the R-390A was designed not to need
> it? Some vastly more quiet and appropriate fan?

Puff up your chest with pride and show off your R-390 boatanchor a
couple times a year to your ham buddies, and the rest of the time use a
Sony ICF whatever they are or similar general coverage receiver. ;-)

Mount a panel with a speaker in it in the rack, and connect the Sony to
it, and your friends will never know. You'll have a lot lower electric
bill this summer. :-))

2359. Seeking SBE documentation

Newsgroup: rec.radio.amateur.boatanchors
Date: 2005-05-28 20:12:18 UTC
From: k5dh@qsl.net
Message-ID: <U_6dnaytc-E_TQXfRVn-sQ@centurytel.net>
Source record: 17948
Cross-posted to: rec.radio.amateur.boatanchors,rec.radio.amateur.equipment

Hi all,

I'm looking for the following SBE manuals:

- SB2-VOX plug-in VOX unit
- SB2-XC plug-in calibrator unit

And these articles from CQ magazine:

- How to Improve your SB-34 Transceiver
by Ed Marriner, W6BLZ, CQ 04/67
- CW and Extended Coverage for the SBE-34
by Katashi Nose, KH6IJ, CQ ??/67
- The SB-34 Transceiver Expanded Coverage
and Convenience
by John Schultz, W2EEY/1 CQ 09/68

Yes, I'm aware of the multitude of online vendors
who sell manuals. The going price is $14 to $16.
That seems a bit unreasonable for a 2 to 4 page
photocopy, don't you think? Besides, I doubt that
any of them have permission to sell copies of SBE's
copyrighted manuals!

If you have the information that I seek and you're
willing to copy it for me, or loan it to me so that
I can copy it myself, I'd love to hear from you.

If you feel some need to stroke your ego by flaming
me, go right ahead. Just be aware that doing so
will tell the rest of the world that you're a jackass.

73,
Dean K5DH

So add a power resistor and drop the voltage until there is around 80V on
the fan. It will move less air, but it will be very quiet.

2372. Transparent label for SB-200 cabinet?

Newsgroup: rec.radio.amateur.boatanchors
Date: 2005-05-29 21:08:50 UTC
From: "Chuck W." <cwyatt@w3minds.com>
Message-ID: <1117400930.636006.123070@g43g2000cwa.googlegroups.com>
Source record: 17961

I just installed a much-needed standby switch to my SB-200. Looks pretty good if I do say so myself. However, I'd like to label it, and would be nice if it was at least something similar to the standard cabinet labels.

Is there a label-making product of some sort that would let me make a nice "Stand-by" label?

Thanks,

Chuck

I have a little label machine made by Casio that makes transparent with
black lettering. They look pretty nice. I have 9mm (1/4") tape, and I
can make 6 different letter sizes. Tell me what you want them to say,
about how tall you want the letters to be, and email your address, and
I'll send some out to you.

Hi Chuck

How nice! Please, what can I do in return?

I was thinking two labels, one should read "STAND BY" and the other "AMP." Pretty small, I can measure the current height, but I imagine it is something like 5 or 6 mm.

You can email me direct if you like: cwyattATw3minds.com (just replace AT with @).

Can I send you a few bucks via Paypal for your trouble?

-Chuck

DATAK has a nice series of rub-on lables, in black and white with
standard electronics verbiage as well as a 3-sheet ham radio series.
They look quite professional. They can be sealed with any of the
clear-coats at hobby shops.

By definition, the producer of a validly copyrighted
derivative work does not need the permission of the owner of the
underlying work. (See the "Gone With the Wind" controversy.) Hence,
the reproducer of the derivative work need not go any farther back
than the producer of the derivative work.

Unique complete working receiver and in pretty nice shape. I've cleaned all controls and have been using it to listen to 20 and 80 meter CW/SSB. Covers 20/40/80/160. Pretty stable. Has a homebrew Q-multiplier tied in to an external box. No mods to the chassis or cabinet. Just needs a good going over by someone. Works like it is.

$175.00 + shipping

IIRC, for the entry license you had to upgrade within a year or lose the
license. I know when I got my Novice ticket, it was that way, either
upgrade or go off the air.

BZZZT! thank you for playing.

To produce a derivative work, no.

To *reproduce* that derivative work for anything other than 'personal
use', or for 'fair use' purposes. yes.

> (See the "Gone With the Wind" controversy.) Hence,
>the reproducer of the derivative work need not go any farther back
>than the producer of the derivative work.

Current copyright law *expressly* disagrees with you. As does a large
body of case law on point.

17 USC 103 (b)
The copyright in a compilation or derivative work extends only to
the material contributed by the author of such work, as distinguished
from the preexisting material employed in the work, and does not imply
any exclusive right in the preexisting material. The copyright in such
work is independent of, and does not affect or enlarge the scope,
duration, ownership, or subsistence of, any copyright protection in
the preexisting material.

But you are free to act as you please. I am not your lawyer, and I am
not advising you on the matter.

Folks,

In researching some old timers in 1930's Callbooks, I notice that there was quite a bit of turnover -- people licensed one year and gone the next.

What was the licensing term (number of years) for ham radio licenses in the 1930's? Back in the early 70's I remember that there were also rules about staying active for so many hours per year, and then the license term was 4 years. Any such conditions on 1930's renewals?

Thanks,

Rick W6NIR

Entry level in the Thirtys was the class B license, which you had to hold for a year before being qualified to take the Class A. Class B could only operate phone on 160 and 10 meters. Class A gave you 80 and 20 meter phone priveleges, no phone on 40 back then and 15 hadn't been invented yet.

You could hold a class B forever if you renewed, you were required to state in your app for renewal that you had been on the air in some previous period.

No Novice in the 30's. Also if you moved to another call area you had to
get another license.
In the 30's there was probably a lot of moving due to the dust bowl and
depression.

The crystal in my filter needs replacing. In general, are the specs of the crystals used in a single
crystal filter any more exact than those used for amateur use? For example, should it be for a
series or parallel application? Is 30 or 40 pf for the load capacitance ok to use when ordering
a new one? Thanks

Hi,
Can anyone advise on the repair of these British 1950s geiger counters?
The one I've had for years has ceased to "click". The power supply tests fine,
and I'm getting a decent voltage to the probe unit.
The GM tube works fine in a different unit and changing to another tube doesn't
help.
All suggestions gratefully received.
TIA

Hi, Gang

The ebay auction has a photo of a crystal in a crystal test set,
which includes a panel meter showing activity.

Do crystals with "low" activity merely provide less drive,
or are they more prone to chirp than highly active crystals?

They use them in guitar amps for the way they transition into distortion,
tone
The RCA with the black plates do sound totally different, they are going
after specific tubes made by spacific factorys , spacific years
They ID them by plates, getters, tops, logos.
A set of domestic GE 6CA7's or RCA 6V6's is a hard find in 2006.
All the Eastern block and Chinese (fancy silkscreen reliable Groove Tubes)
just sound lousy or short
You cant run them in a classic Marshall JTM 45 and play Led
Zepplin.....even if you turn down to 11.

Some of these rock and roll and Bass guitar amps like a 70's Ampeg SVT are
very hard on tubes, who needs a failure in the middle of a show or have lug
a spare 90 pound beast around.

Check out the prices on Telefunken 12AX7's, GE 6550's and British
KT-88's.....OUCH !

Its also very much a vanity thing. The well-eared gang claim to hear subtle differences (always an improvement) in certain tubes and will pay dearly for them...if for no other reason than bragging rights. And then some tubes have a better proven reliability when stretched to abuse - as Joe sez.
I can't hear these differences so to me any 6SN7 will always be just another old TV set tube and anything more than $2/pair is excessive.
If you fancy yourself to be a seller in that market be prepared to have on hand a $500 tube tester sitting somewhere to validate your claims and a tonne of otherwise-useless BS writing skills.
Do some research and find out which ones sell and go for it. That research and effort is what the deep-pocketed audio buyer is ultimately paying for.

>

Are you selling or buying? If you are selling, put it on ebay for 0.01 and the worldwide bidding process will tell you, to the penny, how much its worth.

If you're buying, shuffle your feet a lot and explain how you are a little short this week and offer 20 dollars and go from there.

No, there's not a *reliable* guide. Condition of the gear is of the most importance in rigs of that ilk.

-Bill

Audiophoolery.

Tubes like that between experienced developers go for 1/50 the price.

Checkout "oldconvent" or Gintaras at KWTUBES - real men, no phools ;-)

It does! Particularly with higher currents. Although I never fell for the clear insulation that acts as a magnifier and makes the wire look much bigger. The difference between 22# and 14# is noticeable when making a side by side comparison. Even on a car stereo. Makes a big difference with my trailer lights too!

Anyone have a list of these golden tubes? I just put REL 811a set in my linear and it seems to work just fine. I have (1)ea. new RCA JAN 811a if anyone is interested.

The Oxygen-free feature of copper wire is about enhanced flexibility,
and improved resistance to breaking. Oxygen free copper wire in power
cords and speaker wires lasts longer.

Mostly true, the biggest advantage to oxygen free copper is in applications where the cord gets daily flexing, think of all the times you have found a broken spot in the cord on an iron, vacuum cleaner or shaver. With oxygen free wire, it is supposed to last longer.

Tubes for audiophiles get bid up in strange ways. I once bought a random box of tubes on Ebay because it had a couple of tubes I needed in it. But the seller tossed in all his junkers. Turned out that there were 10 or so TungSol 6SN7s in the box-- dirty, but tested fine. I put them back up on Ebay in the audio group and they sold for about $10 each.

30 years ago, I helped the University of Washington clean out the old electrical engineering building and we tossed out 10's of thousands of tubes in pallet loads. No one was allowed to scrounge, although some of the professors packed away stuff in their car trunks.

Clean out your old dustbins-- might be cash there.

I doubt there is any data to support that, it just that the audiophools fall for the hype hook, line, and sinker while the folks that sell the stuff to them laugh all the way to the bank.

Not sure what you mean. If your missing only a few - then you know what they look like. I suppose you could fabricate new ones easily enough. Many 60's were only equipped with the standard's (A,B,C,D) and perhaps a few more - depending on what coil set's they had. They can be hard to find in the exact band that you're looking for at times.

Buzz, audiophools don't buy the mass marketed IEC standard power cords, such as are used on your PC, but they are all "oxygen-free" copper wire. This is a standard feature of modern copper wire manufacture.

Just recently got a HW-101, with low power out,I can get a few more watts by adjusting the bias slightly above the 20ma mark, how safe is it this?
Since I dont have spare 6146's what should I be looking for that could be a problem other than the finals?

Thanks in advance...Gil

Of all the vacuum cleaners and shavers I have ever owned, don't think I have ever found a broken spot on the cord. If fact, the cord usually outlast the device.

Oxygen free is just for the audiophools to spend outrageous amounts of money on for nothing.

Really? How would you know that? Given that all of the copper wire manufacturers these days have switched over to oxygen-free manufacturing techniques for their copper products.

OBTW, my welding cables fray like the dickens on the connector ends. I have had to reattach the connectors on the stinger side twice now. But then, I actually use them.

All "no oxygen" means is the copper was smelted in a way that prevents the inclusion of oxides in the copper. It is a pure, soft copper. It makes a slightly lower resistance wire than the earlier copper smelting precesses. Being softer, oxygen-free copper can be worked more, and doesn't wear out tooling as quickly as ordinary copper.

Or did you think that it took a highly spiritual audiophool to hold his breath while blessing the wire?

Here are some definitely non audiophool companies that make oxygen free copper products:

Sorry, but the finals are the usual reason for low output. You will go through many sets of finals before you wear out the driver.

Make sure that your replacement finals are 6146, or 6146A's, never B's!

Note, 6146W's can be all three types. The later 6146W's are B's.

Don't get creative with the bias. It has nothing to do with the power output, but everything to do with balancing tube life with low distortion.

When your bias is low, your tubes are cut-off on opposite cycles, and you get cross over distortion. When your bias is high, the tubes are approaching class A operation where they make a good expensive short lived shack heater.

-Chuck

2454. Re: Heath HW-101 bias question

Newsgroup: rec.radio.amateur.boatanchors

From: Edward Knobloch <alias@nowhere.net>
Message-ID: <ZUioe.372$5M2.140@trndny06>
Source record: 17843

Hi,

The bias should be set to 40 mA with both finals installed.
Set the bias by using push to talk mode in SSB, no audio.
If you have another receiver, listen to the carrier output and adjust
the internal notch controls for minimum carrier
with no audio.

Running the HW-101 at 20 mA bias would reduce the output, and worsen the
distortion on SSB.

You can check the balance of your finals by running one at a time,
and setting the bias for 20 mA with a single tube.
(remove the other tube completely, don't just disconnect
the top cap). If the tubes aren't within 5 mA of each other,
I'd look for around for a better balanced set of finals.
I'd do this check on 80m, because by removing one tube,
you are upsetting the neutralization.

73,
Ed Knobloch

You are getting there! What I have been trying to get through to you, and
others, is oxygen-free isn't something the copper wire/rod/tubing manufacturers
spend a lot of time bragging up. It is just a natural step in the evolution
of the copper manufacturing process.

If your copper contains impurities, yes. The oxygen helps oxidize those
impurities, and allows them to come to the surface of castings.

> I'm headed for the store now to see if they have any oxygen-free Romex...
> Need to rewire the house.

How do you know that the Romex you buy isn't oxygen-free? It isn't really
important for an electrician to know whether it is, or isn't. Enhanced
flexibility is useful when you are trying to install fixtures in their
boxes.

Oh, I get it, you think I am an audiophoole, and you are just trying to
make fun of me. My, isn't that special!

Make sure that your replacement finals are 6146, or 6146A's, never
> B's!

I've got to challenge this statement. This rumor has been circulating for several years now. When I received my new HW-100 from Heathkit in 1968, it came with RCA 6146B's. There was a note enclosed that said that they(Heath) were having problems getting 6146A's and that the 6146B's would work fine. They did. The radio neutralized without any problems and stayed that way.

I had the radio for about 10 years and when I sold it, it had the same tubes and still produced full output.

Yes, but I assure you that if Lincoln could get away with it, they would
say just that. Because that's the way marketing works, and marketing sells
products unfortunately.

I don't know about other manufacturers, but the West Penn welding cable is
definitely OFC. It's good stuff.

>>OBTW, my welding cables fray like the dickens on the connector ends. I have

He's probably using it already. But he might consider using dielectric
grease on the ends which seems to help a lot. The clamp connections are
really not mechanically all that sturdy even though they are electrically
solid, and sometimes some 1" heatshrink can do wonders.

>Interesting article here:
>http://www.copper.org/innovations/1997/Dec1997/wiremetallurgy.html
>
>Looks like having at least a little bit of oxygen is a *good* thing.

Again, depends on the application. And for hard-drawn copper the issues
are very different than for soft-drawn wire.

>I'm headed for the store now to see if they have any oxygen-free Romex...
>Need to rewire the house.

Romex is one of the places where higher conductivity is important (since Romex is really lousy at heat dissipation) and flexibility is a total non-issue (since it should only be flexed a couple times during installation). Romex is VERY different than an SJ-type cable and is usually made with much more brittle wire.

That's probably because you take care of the cord. Although actually most
of the vacuum cleaner cord failures are at the connector ends, and are
usually because SOME people unplug the thing by pulling on the cord and
eventually weaken the connection at the plug.

>Oxygen free is just for the audiophools to spend outrageous amounts of
>money on for nothing.

You'd be surprised how much commercial cable today is OFC. They might not
advertise it, but if you're buying cordage today it's almost certainly
made with OFC material.

That there are big differences between the 6146(A), and the 6146B is not
a rumour. It shows up on the spec sheets as different interelectrode
capacitances. The 6146B had a bigger plate size, and handled something like
a third more plate dissipation.

It would have been better if I had said that you must use which ever was
certified by the manufacturer, straights, A's or B's.

Heath had already made the necessary modifications to the final section of your
radio. You would probably have had problems if you tried A's.

The 6146B should have been issued a new number.

Yes, there are diffences between the A and B versions. There are also differences between various manufacturers. However, that doesn't change the fact that the two tubes are generally interchangeable. All of the hoopla got started when an article was written about some problems Motorola had with some VHF gear that was designed around the 6146A and had fixed neutralization. Their attempt to stadardize around the 6146B caused them some problems.

The bottom line is, if it will neutralize, it will work fine. Frankly, I've never found a piece of ham gear they won't work in. A partial list of radios I have used them in with NO PROBLEMS:

COLLINS: KWM2A, 32S3A
GONSET: Commander
HEATHKIT: DX-60, DX100, HW-100, HW-101, Apache
JOHNSON: Ranger, Valiant, Viking II
KNIGHT: T-150
MULTI ELMAC: AF67, AF68
WRL: Globe Scout 680A

There are others. Like I said, I've never found an example where they won't work, and work well. I haven't tried them on VHF equipment. I'll be the first to admit that there could be a problem there.

Here is a link buzz. If you can find someone to read it to you,
you might find it illuminating:

http://home.comcast.net/~k9sth/The_6146_Family_of_Tubes_1.htm

And here's an excerpt from the above link:

"RCA "claimed" that the 6146B was directly interchangeable with the earlier members of the 6146 family. Unfortunately,
this did not hold true in most cases. Collins, Heath, and probably other companies, at first issued various documents
saying that the use of the 6146B in their equipment was "fine". But, this soon proved otherwise!

For example, when the 6146B was used in the Collins 32S-1, 32S-2, 32S-3, 32S-3A, KWM-2, and KWM-2A it was discovered
that the components in the neutralization circuitry "burned up" in a very short amount of time. Thus, Collins had to
retract the statement that it was "OK" to use the 6146B. Then, due to the fact that the United States military
establishment wanted to "standardize" on the 6146W equivalent of the 6146B, the neutralization components had to be
redesigned to allow the 6146B to be used. Fortunately, these changes did not affect the use

of the earlier 6146 and
6146A in those transmitters manufactured to use the 6146B. All three types of tubes may be used without any problem in
these transmitters.

Replacing the 6146 / 6146A tubes with 6146B types often results in spurious emissions, parasitic oscillations, etc. This
is due to the fact that there are different bias requirements, different inter-electrode capacitances, etc. of the 6146B
versus the other two. It is often difficult to neutralize 6146B tubes when used in place of the 6146 / 6146A. If
neutralization can be achieved, often it lasts for just a few minutes before the tube(s) goes into oscillation."

Somewhere, in my files, I have the ECO sheets from Collins that discuss the 6146B,
and the changes that need to made for the KWM2(A) to safely use the tube.

Later model KWM-2(A) and 32S transmitters had these changes already incorporated when
they came from the factory.

The changes for the HW100, 101, SB100,and 101, can be found through a little
light searching on the web. The SB102 always had the change, IIRC.

I can cut plastic to shape, and can probably find transfer letters, but how many dial divisions should there be on each one, and how far from the end of the plastic would each scale begin and end? Even the exact end points would be useful.

Those scales are what you tweaked your coil sets to. These are the references for coil adjustment.

What I would like is just the results of lying a set of them on a copy machine, and pushing start.

I had hoped that someone had a fairly complete coil set, and could do this. Then, I suppose, I could have a go at making a duplicate.

Exciter for the RCA FM-1 broadcast transmitter needs a capacitor change
if you go to the B version. Details are in the manual. This is a
single-ended gain stage that drives about 10W into the final.

The only difference in capacitance I see is Cgp, 0.24 pF for the 6146A vs. 0.22 pF for the 6146 and the 6146B. Doesn't sound like any difference at all, unless maybe the average values are quite a bit different for the 6146B vs. the other two (but what would cause that?). I don't question those who say there's a problem with some rigs, but on paper all three tubes do seem to be the same (at the lower screen voltage the 6146 is designed for). Apparently RCA thought the same thing.

No conclusions, just ruminations...

There is no real difference. The 6146B was very popular in the 1960's.
Everyone was switching over to them with no problems. Trust me, I was
there. One guy writes an article expressing an erroneous opinion about them
and it becomes fact. It's nothing but an internet myth. Maybe he wanted to
corner the market on the 6146B's? Like I said, I'm still looking for a
radio they won't work in.

Hi Mike,

Neutralization is more than just interelectrode capacitance. It is
also affected by plate to everything outside the tube capacitance, and,
of course, the layout of the transmitter finals cage.

The plate of the 6146B is bigger than the 6146, or 6146A. It has about
33% more plate dissipation as a result. There is more coupling between
this bigger plate, and the outside world. As was pointed out by another
poster, it also requires a higher screen voltage.

In order to accomodate the 6146B, Collins completely redesigned the
neutralization circuitry on the S-Line transmitters, and the KWM-2(A).

The old circuitry had a 8-50pf PA neutralization capacitor, the new
circuitry has a 1.8-8.7pf PA neutralization capacitor.

If you put 6146B's in a KWM2(A) with the 8-50pf neutralization cap, you
will be replacing all of the neutralization circuitry in the near future.

-Chuck

If I may, I would like to ask you a clarification on your e-bay listing.

You state that, to bid on that listing, one must have at least 10 ebay transactions with no negative feedback.

What would would happen if somebody with less than 10 feedbacks places a bid at the very last minute, wins the bid and immediately pays you?

Thanks and 73.

How about the Paper Port (*.max) format? The files are quite small
in 2 bit B&W, and there is a free stand alone viewer. You can see a few
scans and the get the viewer at:

Take a trip to El Paso and ask the guys at QMX to make you one. It's
not very expensive.

Source record: 17783

Hi

I wonder if anyone has any info on this small military tube set made in the USA during the 1960s by Alvin Industries. The set is battery or 24v powered and covers 20-100MHz.

I picked one up recently and have never seen one here in Australia before. It may have been a sample as the serial no is 16.

I can find no information on the net and am looking for a schematic or manual to download. Unfortunately the set is in rather poor condition having been stored in a damp environment for several years!

Simon

Having yet another non-standard format is not a good option. Also, it appears to me that the .max format may only have a reader for the PC. Us Mac users have some problems there.

I don't care for djvu, but it gets the job done (somewhat). When I need to use it, I convert the image to a format I can edit to cut clean-up the fuzzy edges left by enlarging the, usually too small, djvu image.

Does anyone know of any sources where I might obtain brushes for an old Ohmite Variac (autotransformer)? Ohmite quit making them 5 to 10 years ago and, as with anything manufactured anymore...if it's older than a week or so, the manufacturer drops parts support.

I have been cautioned against using brushes made for electric motors so I'd appreciate anyone with a source for these kinds of brushes.

Thanks!

are " misposting " the ebay urls intentionally ? ..... or is it a
mistake ? the auction locations you are posting (read them
yourself) do NOT reflect the auction number urls.
(only item 577...)

people " can " find your frg-7 auction and the 7 others by searching
" by seller " and typing in your " kk4tl_is_me " ebay ID and then
going roundabout to " sellers items " .

typing in yaesu FRG-7 in a general ebay search also works .....

73s
k.....

Message-ID: <gMlpe.21999$J73.7764@trnddc05>
Source record: 17697

hello all,

i have the follow ing for sale. all prices are PLUS shipping from 33830. i will accept offers and the price is negotiable. the reason for selling the items is i am saving up to buy a rig that will travel with me in my camper. and also, there are so many projects going on here, i don't have the time to deal with them all. SO, before they go to the "auction place" i thought i'd offer them here first.

1. Hammarlund HQ-129X. New face plate as done by the ham selling them for 60 bucks a pop on ebay. it was worth it. it looks new. tuning, sesitivity, band spread and audio knobs are not original. they look like collins knobs, but not sure. i repainted the cabinet with hammertone black paint and it turned out well. i have replaced the old dials with newer ones. the newer ones have blemishes but at least you can read the frequency. the receiver does work, however would need to be gone through to ensure it is right. price: $150.00 obo.

2. National NC-300 with calibrator. Does not presently work. cabinet would need re-paint. the face is better but not outstanding. all the knobs are there. i bought this with thoughts of restoring. no time. price: $100.00 obo.

3. Heathkit q multiplier model qf-1. nice shape. i have never used it. $25.00 obo.

4. VFO assembly out of a hw-101 heathkit. was going to homebrew an external vfo. have a sb-640 coming so no longer need it. $10.00

i'll snap pitures of this stuff for those who want them. local pickup is no problem. just email me and we'll work something out.

thanks and hope everyone is doing well. 73 mike ku4yp

That is a bad position for Cingular to take; easy and lacking of a
responsible view. Cingular puts their stamp of approval on a retailer by
letting them sell the Cingular service. If the retailer defaults to
Cingular, Cingular should still make good to the purchasers.

The involved Cingular people are irresponsible (promoted beyond their
capability) in stiffing the buyers of their service. I'd escalate the
problem up the ladder at Cingular.

Do you not have a Small Claims court?

Lawyers aren't allowed and the judges' decision is final, no appeals.

We have a legal system, not a justice system like years ago especially in NY
If they are under bankrupts protection you cant collect zip or die before
you see anything.
.....what my lawyer said.
I'm filing with Nassau county Dpt Consumer affairs, and NYS Attorney general
then getting back to boatanchors.

More concerned how I'm going to get quick parts, assorted cable around here
(Long Island) aside letting stuff clutter my bench for days awaiting mailed
NTE from Mouser, Angela, whoever.
All Radio Shacks parts draws in Long Island are useless or empty, to many
yuppies :)
This whole story is becoming an epidemic around her as real estate and
commercial property rents skyrocket

"Lou"

Forget the States Attorney. File a claim with the Bankruptcy court
handling the case. That will be your only recourse and only after the
larger creditors are satisfied.

2520. Squeal from Hallicrafters Mark II CB

Newsgroup: rec.radio.amateur.boatanchors
Date: 2005-06-08 13:35:06 UTC
From: "Dirty Q. Tip" <unavailable@e-mail.com>
Message-ID: <4arda11vph0bj20oa9mk7ccpfldsr1jc45@4ax.com>
Source record: 17710

Here's the deal. I've got a Hallicrafters Mark II (2) 6 channel CB radio. This thing is really old - it still has my grandfather's old radio ID taped to it (xxx####, x=letter, #=number). Anyhow, I took it to my friend's house the other day, and wired it up to his existing CB setup's connections to test it.

Positive to positive, negative to negative (case is grounded as well), attached the coax. Powered it up, lights came on, and got nothing but static on Channel 19. During a brief (under 1 second) key-up, the radio squealed - that's the only way I can describe the sound; or perhaps a whine might also be a good descriptive sound. Also, the red transmit light (I assume that's what it is) came on immediately after keying up, turned off before I could release the mic key, and flashed once again after I released the mic key. During the time the mic was keyed (tried it several times, never longer than 1 second), the radio would squeal. I'm not talking about squeal through the speaker, I mean the circuit itself squealed/whined.

Any thoughts or ideas? My grandpa was a smart man, and kept all of the documents on this radio (including the receipt and the business card of the guy he bought it from, they're in my closet somewhere), so I've got the schematics and the user's manual for the unit. Problem is, I know almost nothing about troubleshooting radio equipment. Hence, I have no clue where to even begin. A starting point and any additional guideance would be much appreciated.

I openly admit, I'm not certified to work on radios. However, once I can get this thing to transmit without squeal/whine and receive again, it's going back on a shelf until I can afford to get a cert'd tech to inspect and tune it as needed. I don't intend to break any laws by working on the unit, I just desire to get it operational again. I'm thinking it could be feedback from a blown final transistor (complete guess).

I consider what I'm going to do akin to fixing your car before taking it in for a smog test..... I'm just fixing it, and I'm not going to operate it until after a tech inspects it (and even then, I might not operate it, instead opting to keep it as a collector's item and family memorabilia).

My reasoning for wanting to fix this CB rather than use it as a boat anchor is that it was my grandpa's radio, and I'd love to restore it in his honor (might seem lame, but it's a personal thing).

Bringing a 40-50 year old set back from the dead usually involves a
serious effort of checking/replacing components. If they are (or once
they are) all good then it stands a good chance of working. Any
electrolytic or paper capacitors probably need replacement, maybe even
some of the plastic molded ones from that era (I'm guessing late 60s?).
Check resistor values for drift, clean controls, etc.

Its not expensive to do but if you've never done anything like that
before this might not be the best set to learn on. On the positive
side, you can't hurt it at this stage.

If you want to give it a go, first try to find a schematic for it - ie
road map for an unknown journey. It should be in SAMs which is
available at many big city libraries.

Update - It's a Hallicrafters CB-5 Mark II.

I have schematics already. I guess it's time for me to exercise that capacitor meter I blew $200+ on. I can easily test diodes, transistors, diodes, capacitors, and resistors, and I'm pretty good at soldering as well, so this should hopefully this will just be a time-consuming project.

I was wondering if perhaps someone might know what section of the CB could be causing this (final stage, etc - it's not the main power supply section). That might get me going the right direction... as is, aside from removing components and checking their values, I'm stumped.

The power supply and xmtr or AF output stage...which are equally as old and deteriorated as any other part of the radio :) That said, all it takes is a single leaky/shorted cap somewhere else in the ckt to bollox the whole works.

There's a different philosophy in bringing an old junker back into service as compared to troubleshooting a radio that just quit yesterday.

I don't have an example of both tubes in front of me, but I don't remember the plate structure of a 6146B being larger than a 6146(A). Can anybody confirm that the 6146B plate structure is bigger? I thought the higher plate dissipation was due to some combination of different plate material and/or thicker plate material.

Is it possible that the Collins neutralizing capacitor range was marginal to begin with, and that the higher power that the B tubes were capable of just brought the problem to the surface? Just wondering...

73,
Mike, KK6GM

Hi Mike,

Collins went from a 7-50pf, to a 1.5-8.7pf. They made a few other tweaks
in the neutralization circuitry too. I have worked on both pre, and
post neutralization modification KWM-2's, and I can tell you that when used
with the proper tubes, the caps in either end up in the center of their range.

The KWM2A that is in my station right now has 6146W's, and the 1.5-8.7pf
neutralization cap, and the cap is in the center of its range. The heaters
on my 6146W's barely glow, so they are probably 6146A's. I don't recall,
are the B's dark heater too?

You get the same power out on the KWM-2 with any of the 6146 family, so I
don't think excess power output is the problem.

Collins said that the original neutralization circuitry tended to burn up
with the 6146B tubes. I'm willing to trust Collins to know the why's and

wherefores.

You can view the complete Heathkit SB101 ECO notes somewhere on the net. Heath said there is something different about the 6146B's that requires changes in the PA section. [They also had a tremendous problem with variations in other tubes made by different manufacturers. They out and out banned certain manufacturer's tubes from use in their rigs.]

That the 6146B is different isn't just the rumblings of some flaky ham. Collins and Heath made the necessary changes shortly after the B came out, and long before I ever owned a rig using a 6146.

-Chuck

Interesting product, but, like it or not, pf is the industry
standard. You can tell that by what Scan Soft say in their ad for
Paper Port Pro 10 at http://www.scansoft.com/paperport/
I can't really justify the expense of Adobe Acrobat and Paper Port 10
both since all the operating expenses for BAMA come out of my pocket.
Saving space used to be a major constraint on BAMA, but storage space
is now very cheap. Of course, I still try to reduce the size of pf
files as much as possible realizing that there are many folks who are
stuck with dial-up connections to the Internet.

I had one of the first Heathkit HW-100's. I was on a waiting list before they ever made the first shipment. Mine came with 6146B's. If there was any change, it would have to of been made in the first few hundred. Like I have said, the card that came with my HW-100 said they were equivalent. I've seen dozens of them with both versions. They all worked just fine. I still say it's nothing but an internet myth.

Hi,

I had two of those babies and I miss them.

The squeal is likely in the T/R switching - the audio isn't getting cutoff from the speaker and sent to the plate of the 6AQ5 (IIRC) final tube correctly.

The only caps you'll need to change are electro's and dust off the variables.

Watch the driver coil assembly - it buggers up and causes touchy tuning.

Enjoy your treasure! :-)

Doing some casual research, I find that Heath did indeed know about the problem, as early as January, 1978, but in 1979, when they had no choice, they gave approval to use the 6146B.

----------QUOTED FROM HEATHKIT's CHANGE BULLETINS----------

****
JANUARY 20, 1978
HW-101 BULLETIN NO:
SSB TRANSCEIVER HW-101-18

RF CHOKE IN FINAL PLATE CIRCUIT OVERHEATS OR
DIFFICULT TO NEUTRALIZE ON 10 METER & 15 METER BANDS

6146B tubes in the final amplifier may be causing this problem. To correct, replace with 6146A tubes.

A label will be installed on the back panel of the HW-101 recommending the use of 6146A tubes only. The 6146B tubes should not be used as a replacement.

NOVEMBER 20, 1978
HW-101 BULLETIN NO:
SSB TRANSCEIVER HW-101-39

IDENTIFICTION OF THE 6146A TUBES

The 6146A tubes [PN 411-75] used at V8 and V9 of this unit are marked '6146A' in white ink on the side of the tube. These tubes may also have '6146B' etched in the galss. These tubes have been reworked by G.E. and are acceptable for use in the HW-101. Most tube cartons will contain the following insert to explain the situation to the customer:

IMPORTANT INFORMATION;
THE TUBE SUPPLIED WITH THIS NOTICE IS TYPE 6146A, AS PRINTED ON ONE SIDE

OF THE TUBE, EVEN THOUGH THERE MAY BE A 6146B ETCHED ELSEWHERE ON THE
TUBE ENVELOPE.

ALWAYS REPLACE V8 AND V9 WITH 6146A TYPE TUBES

Replace the backing from this label and place the label at any convenient
location inside the cabinet top.

May 15, 1979
HW-101 Bulletin No:
SSB Transceiver HW-101-49

Changeover To 6146B Finals

The 6146A final amplifier tubes are no longer available from the
manufacturer. Future productions runs will use the 6146Bs. These are GE
brand tubes and have been tested in the HW-101. No difficulty was
encountered in neutralizing the finals; nor did the RF choke in the final
plate circuit overheat. The tube replacement label [PN 390-146] should
be removed from all units brought in for service.

----------QUOTED FROM HEATHKIT's CHANGE BULLETINS----------

I haven't yet found the bulletin mentioned by Zook, but everything he stated fits the above bulletins.

To recap, he said that 1) heath forbid the use of 6146B's
2) Heath switched to B's when GE stopped making A's
3) Heath came to regret it.

I need to find the Bulletins from past 1979. That is where the meat is.

-Chuck Harris

Are you sure you're thinking of the right rig? This critter uses a pair of "3B4" tubes, and one "3A4" tubes... I checked all three, and they're all genuine Hallicrafters tubes. And honestly, I haven't even looked at the scats for it very closely. Driver coil assembly..... I'll have to locate that and avoid mucking with it.

Just out of curiousity, is there anything "special" this unit can do if one were to, say, modify an actual functioning CB-5 Mark II in a manner which it shouldn't necessarily be? I know nothing about these older tube units other than they can give you a decent lil zap.

Also, I inspected the mic wiring - talk about horrid. I suppose several years of storage will dry rot some wire insulation. Only the mic wires are showing this deterioration, and it has been temporarily rectified. Still, the radio will not transmit nor receive.

I'll be re-capping the electrolytics soon enough, and much to my surprise, this unit is dust-free on the inside! Well, almost completely dust-free. I'll also be testing the power transistors attached to the back - there's four 2N376A's and one 2N555 (all Motorola) I can check while I'm at it. You might be hearing more inquiries from me, or you might soon hear that the unit is alive once again. Who knows. But either way, thank you everyone for responding, and if you can think of anything else, feel free to pass along the info.

Just recollecting out loud...I recall the VHF 2-way rigs of that era that were solid-state with a tube final that audibly squealed internally on xmt. I'm not sure why but that was pretty common. solid state 'vibrator' PS for the B+?

The fact that your Halli squeals may be a good sign rather than a bad one. I'd still do the recapping/check resistor rote.

Huh? The tubes in the HW-101 are in parallel, not in push-pull!!

Well, at any rate, I've got the Sams Photofact #6 in transit. I'm not about to start pulling out caps and resistors without a "map" to guide me. Sure, I've got the schematics from Hallicrafters, but I'd rather have two schematics by diffrent publishers to compare, and one CB to work with. I hate it when one reference book says "it goes here," and "here" doesn't exist. Also, I notice no one has free scats for the CB-5 Mark II Hallicrafters. I might have to rectify this situation for the benefit of "us all" in the near future.

A senior moment, and audio habits, made that phrase come out. Sorry!

A resonating tank circuit makes how you think of Class A, AB, B, and C
operation somewhat different, though.

(A = 360 degree plate conduction;
AB1 = less than 360, but more than 180 degree conduction, no grid current;
AB2 = less than 360, but more than 180 degree conduction, w/some grid current;
B = 180 degree plate conduction;
C = less than 180 degree plate conduction.)

The tank "free-wheels" through the areas of non-conduction in the RF signal,
effectively taking the place of the second tube in a push-pull amplifier,
thus making AB, B, and C modes of operation usable with one tube.

But the tank does nothing to improve amplification linearity.

The correct amount of bias is still chosen for the same reasons as in the
push-pull amplifier: so that the stage remains suitably linear under normal
operation, and tube life is adequate for the mission. In this case, the
correct bias puts the stage in the Class AB1 region.

The OP was running a pair of 6146's, at 20ma bias, and commenting on how
turning the bias up a bit made his too low output power rise a little.
I assumed he meant 20 ma each tube, as the usual bias for a pair of
6146's (ala Collins) is 40ma, 50ma if you are running into a linear.

If he was indeed running 40ma to a pair of 6146's, and his output power
was still too low, the usual reason is he has a used up pair of finals.

And the thread went (some would say downhill) from there...

-Chuck

I removed the MFP from the knobs of an old HRO I
purchased. I subsequently decided that this was a
mistake and want to restore the knobs to original.
Is there anything that can be sprayed/painted on to
restore the original look of the MFP?

Thanks, Roger

I use clear Krylon. It gives a reasonable finish. Just make sure the nozzle isn't spitting so you'll get a uniform coating. Also, don't overdo it!!. Real MFP generally has a yellowish cast to it, whereas clear Krylon does not. If the knobs are dark, it won't matter. If necessary, one could use a tinted varnish, applied manually, but the spray is a lot easier. Good luck.

Oh I'm sure they're just looking for offers...
Every time you turn around someone wants to sell
something, but they want you to tell them what you'll
give for instead of putting a price on it.
I NEVER make blind offers on someone else's stuff.
If they want to sale it, they should put a price on it.

Just my .02 worth...

Ron

2557. Identify High Current Power Supply Transformer

Newsgroup: rec.radio.amateur.boatanchors
Date: 2005-06-10 13:49:00 UTC
From: pinpassion <mjdrum@comcast.net>
Message-ID: <1118411340.597942.19740@o13g2000cwo.googlegroups.com>
Source record: 17646

Hi Gang,

I have a large and heavy power supply transformer
that is part of a high current power supply project
that was featured in 73 magazine back in 1973. It
was started by a ham radio operator and was never
finished. I am going to finish it, if I can. I am
trying to identify the transformer leads. This is
for a 12 volt, 40 to 60 amp output. Here are the markings:

This transformer was made by ADC and is marked 541-010 REV H.
There is a marking on it that says 3-19470 and what I think
is a date code of 7438. There are terminal connections on one
side that are numbered 1 - 6. On the other side the connections
are numbered 7 - 14. I need to know the connection scheme for
this transformer so I can put it to use. I contacted who I
thought was the manufacturer "ADC" for information, and that
did not help.

I don't have the issue of 73 magazine, and I don't even know
if this is the same transformer that may have been part of the
construction article. I can take pictures and post them if that
might help.

Anybody have any ideas?

Thanks a lot.

Mike

That's bad. I'll see if I can have a friend down there give them a
visit.

I last ordered from them about a year ago, and they charged me something
like $6 each for VHF crystals, versus about $20 at ICM.

You may have to bite the bullet and pay twenty or thirty bucks.

I think that with an AC voltmeter and a 6V filament transformer, you
can apply 6V to each winding in turn and check the voltage on the
other windings, and with an afternoon's work you can figure out what
the primary and secondary winding ratios are.

First get an ohmmeter and find out which terminals connect to which
others. You'll find a bunch of them are unused. You'll find probably
several pairs of pins that connect to each other but not to any other
pins. Those are individual windings. You may find a group of three
or more pins that connect together; these are tapped windings and by
looking at the resistance you should be able to figure out which pins
are the edges and which ones are taps and what order the taps are in.

As long as you know this is a 60 Hz power transformer and there is nothing
too weird about it, you should be good to go.

Apply 6V to one winding... if you find 6V on an adjacent winding, you
know they are 1:1. If you find 60V, you have a 1:10 voltage ratio.

Incidentally, I need an impedance protected transformer that will put
out about 40A with taps from, say about 25V to 40V, in order to run
a projection arc. If anybody has one on the east coast that they don't
want, I'd love to know.

MFP stands for oisture ungus
roofing

It is a varnish with an mild poison added. It tends
to turn lemon yellow in color, and really looks kind of
dowdy.

The military sprayed lots of electronic equipment, inside
and out, with MFP. Sometimes they masked of parts that
shouldn't be sprayed, sometimes they didn't.

Here are some items for sale. Prices do not include shipping. I will
ship overseas. Reply to n7rk@cox.net

Heathkit IB-2A Impedance Bridge.....$100 plus shipping
This is a working unit in excellent condition.
http://members.cox.net/radiostuff9/heathib2a.JPG
http://members.cox.net/radiostuff9/heathib2a2.JPG

Heathkit C-3 Capacitor (Condenser) Checker.....$40 plus shipping
This unit is in nice shape and works great. The eye tube is bright.
Includes a photo copy of the manual.
http://members.cox.net/radiodx3/heath_c3.jpg
http://members.cox.net/radiodx3/heathc32.JPG

Superior Instruments Model TV-50 RF Signal Generator...$40 plus shipping
Combination RF signal generator, audio frequency generator in addition
to providing several other functions. The frequency coverage is 100 kHz
to 60 MHz in six bands. The unit is in very nice condition both inside
and out and works great.
http://members.cox.net/radiodx3/superior_genometer.JPG
http://members.cox.net/radiodx3/superior_genometer2.JPG

National RAS HRO Junior Reciever Coil Set and Box.....$50 plus shipping
The 5 coils are as follows: 1 - 190-450 kHz, 4 - 2-4 MHz (80/75 meters),
5 - 4-7 MHz, 6 - 7-14 MHz (40 and 30 meters)
and 7 - 14 -30 MHz (20, 15 and 10 meters). The coils and wooden box are
in great shape. All coils work except coil 1 which has an open.
http://members.cox.net/radiostuff9/ras_coilset.JPG
http://members.cox.net/radiostuff9/ras_coilset1.JPG
http://members.cox.net/radiostuff9/ras_coilset2.JPG
http://members.cox.net/radiostuff9/ras_coilset3.JPG
http://members.cox.net/radiostuff9/ras_coilset4.JPG
http://members.cox.net/radiostuff9/ras_coilset5.JPG

Hallicrafters SR-42.....$75 plus shipping
A separate transmitter receiver that puts out 5-6 watts and covers
144-148 MHz. This is a crystal controlled radio that also has provisions
for the HA-26 VFO It will probably will work with other VFO's with an 24
MHz fundamental frequency. The transmitter uses 24 MHz crystals and
includes two crystals for 145.14 MHz and 146.52 MHz. I used this for a
while with the HA-26 VFO to check into our local 2 meter AM net. The
unit works well and has good audio. It does have some scratches and
spots where the paint is missing. Includes the microphone, power cord
(often missing) and a photocopy of the manual.
http://members.cox.net/radiodx3/hallisr42.JPG

http://members.cox.net/radiodx3/hallisr423.JPG

Electro-Voice EV-621L Dynamic Desk Microphone.....$50 plus shipping
Low impedance desk mike. Tested and working, the mike is in nice shape
with a few minor scuffs.
http://members.cox.net/radiostuff9/ev621l.JPG

James Millen Frequency Meter Set I-129-(B).......$45 plus shipping
Military set of four James Millen wavemeters covering 1.5 to 40 MHz.
This is the Signal Corps U.S. Army version and the box says manufactured
by Munston Mfg. and Service. The wavemeters were manufactured by James
Millen. These are in excellent condition. The wooden carrying case has
the callsign of a previous owner. Here are the frequencies of each
wavemeter:
*Meter No. 1: 1.5-3.5 MHz, *Meter No. 2: 3.5 - 8 MHz, *Meter No. 3: 8 -
18 MHz, *Meter No. 4: 18 - 40 MHz
http://members.cox.net/radiostuff9/wavemeterset3.JPG
http://members.cox.net/radiostuff9/wavemeterset.JPG
http://members.cox.net/radiostuff9/wavemeterset4.JPG

Akai 1710 Reel to Reel Tape Deck/Recorder/Stereo.....$100 plus shipping
This is a four track, stereophonic and monophonic tape recorder. This
unit has been tested and works well. Cosmetically, it is in very good
condition.
http://members.cox.net/radiostuff9/akai17102.JPG

The stand alone reader software comes with the scanner software. I bought a Visioneer 4400 USB a couple years ago for less than $50 and got Paperport with it. I like that I can straighten scans with it. For PDF files I use an older version of PDF995, before they started charging for it. The PDF files on my website http://home.earthlink.net/~mike.terrell/ (and others) were created with PDF995 It also has the option to encrypt a file so I can post a file for someone, e-mail them the password so no one else can access the file.

I wasn't advocating that you switch to it, but it is a compact and useful format. After I scan files I can post them in *.max format, or convert them to bit mapped files and convert them to *.gif format. Paperport doesn't support *.GIF for licensing reasons. I was just asking if files could be added in that format, if the reader is provided. A lot of antique radio manuals are scanned in *.max format and are available on the net that way. I have been converting my collection of paper test equipment manuals to that format. I spend a lot of time cleaning up each page, and aligning and splicing parts of multi-page schematics. I usually get the splices to align to one pixel offset, top to bottom. Also, i scan at 300 DPI so I can do OCR on the text part of manuals to convert it to clean text. I can use this, with the scanned graphics to create a very nice PDF but it can take a couple weeks to do a single manual.

>My lawyer wants 20X more $$ then the bills just to start a case, these
>Monopoly companys clearly know this.
>Its like fighting Ma Bell and City hall

I have to ask:
Who was your contract with?
Who was billing you for the service?
Who were you sending payments to?

dig out the paperwork and look it up.

It makes a *big* difference if Electronic city was acting a _agent_ of
Cingular, or as a _reseller_ of Cingular's services. Ditto for the paging
Company.

If agent, then your contract, etc was with Cingular directly.
if reseller *your* contract was with EC, and they had a separate contractual
arrangement with Cingular.

If agent, Cingular _is_ responsible for their actions.

If 'reseller', then _as_far_as_Cingular_is_concerned_, EC is the customer.
-you- are not even a part of the picture. Cingular could care less if
you paid EC, EC is still required to pay _them_, even if you default.
(As Cingular sees it, in _that_ situation, EC is acting as _your_
'representative' to them.)

Now, if this was the 'usual' phone billing, where the base monthly charge
is billed "in advance", and EC billed you -- _and_you_had_paid_ -- for a
period past the point which service was cut off, you have the basis for
criminal charges against EC -- 'theft by deception' or something similar.

On the *remote* possibility that the contract was actually with Cingular
you would have a slam-dunk *big-dollar* punitive damages suit against them.
Something that would have any 'contingency fee' lawyer _drooling_ over.

Given the fact that your lawyer has put such a high price tag on _starting_ things -- which by they way is a fairly common tactic when they don't wish to out-and-out contradict a client by saying 'no' -- *and* postulating that he did review the contracts before offering advice; it seems *VERY* unlikely that your contract is with Cingular. That EC was not operating under a 'delegation of agency' from Cingular.

I have for sale a Spectronics DD-1C Digital Display For Collins S-Line gear including the KWM-2/As. It is in good cosmetic condition and it works, but several of the Red Display #s are needing replaced. There are some missing parts of some of the red digits. These are the good readout for Collins gear.
I will sell this one for $50. Thanks, Charlie Hugg,
K5MBX

2577. George Carlin's view for we old tech guys

Newsgroup: rec.radio.amateur.boatanchors

From: "G.T. Tyson" <gtyson@nc.rr.com>
Message-ID: <Q5%qe.5984$1u3.227811@twister.southeast.rr.com>
Source record: 17667

I was assisting an engineer friend in cleaning out an old radio station building and came across a Gates M-4990 frequency monitor. I'm not sure of its date of manufacture or how long it has been out of service. All but one of the tubes light up when power is applied. I do not have any test equipment on hand to further verify its functionality.
The unit came from a station which operated on 930 khz.
Would anyone out there care to make an offer? I am working on getting some photos of the unit and will gladly share them with anyone who responds. Ebay will be my next stop, but I would like some idea where to start with a minimum bid.

This expedition also yielded two McMartin TN-77CB FM SCA recievers. These were used by the FM side of the same station and were placed in businesses who subscribed to the station's Muzak subcarrier.
I'm guessing these are early 1960s vintage. Again, I do not have the test equipment to further verify their functionality, but these items did not shoot sparks when I powered them up, so I guess that's a start.
The FM subcarrier signal came from a station which operated on 93.3 mhz.

Any input on these items would be appreciated. I tried a Google search on both items but got no responses.

Smokey:

Analog cellular was the first generation, and as such worked just fine in a lot of situations. Sure, as you got to the edges of range you experienced noise, but I actually preferred that to the current method of just being dropped without warning...

A more direct answer to your question was the cost of providing the service. With Analog, you had a limited number of channels available. Period, end of story. More channels meant more equipment, and so on. Profit was not great enough for some of the providers... Enter the Digital Cellular processes... With a single channel, they could simultaneously deal with a number of virtual circuits through the wonders of TDM (Time Division Multiplexing). Because we don't really need a full spectrum signal for audio, with a decent TDM ratio, it sounds as good as Analog. However, what makes the phones sound like crap are twofold. First, the cheap phones don't necessarily care as much about the actual sound as the "features" like text messaging, color displays and custom ring tones that sell the phones. Second, and most important, the carriers are either too greedy or using systems that are too overloaded, and as a result are slicing the same second among many subscribers, instead of a relative few. For example, let's say that a given TDM channel has 100 slots available, that means each slot gets roughly 10ms of data time per second. When the channel is lightly loaded, the computers may be set to give you 10 time slots per second, which means you get 100ms of data time per second, and the phone sounds pretty good. However, as the number of active conversations on a single channel increases, the number of time slots you get is fewer, so the relative compression of the signal needs to go up. In another way of putting it, the bitrate you receive goes down as the channel is more heavily loaded. Given a CD sounds good at 44khz bit rate, if you could transfer this rate to the cellular phone, it (within limits of the speaker and mic of the phone) would provide near CD quality. If the bitrate is only 8khz, it's not going to sound near as good. As the number of active conversations on a channel goes up, the equivalent bitrate you are provided has to go down, often to ridiculous levels. The cell phone companies tend to move towards insanely low bitrates to maintain the connection as they add more active circuits to the channel, instead of denying a new connection to the same channel. This makes some people happy, because they can (almost) always get a connection, and makes the provider happy, because he can get by with less equipment which makes his profit higher.

Unfortunately for some of us, this means we are unhappy because we know how it could really sound if we weren't being cheated out of the bandwidth we [pay for and deserve. Of course, the providers don't look at it this way, because they "make no guarantee of service (level) in any particular area".

The increasing number of people using cellular technology, and their relative inexperience with quality communications only exacerbates the problem, as they really don't know what they are missing. Hell, I've had many a long distance QSO on SSB that had much better audio than the typical conversation with my wife a few miles away on what passes for "Cellular Service" here. (I live on Hawaii Island, also known as the big island, the southernmost island of the Hawaiian Chain. As it is large, mountainous and with relatively low population density, cellular service here is spotty at best, no matter which provider you use, and they all tend to overload their systems to avoid equipment upgrades and expansion).

Good Luck!

I've been around this hobby a long time and the
typical non collector out there is thinking that
they've got the holy grail of radios, "one only one there is",
a "prototype" and they just want some big gun collector
to come along and make them rich.

As an example, I got a phone call a while back from
a man that had a "prototype" tube tester. He said
he had talked to the folks at Southeby's about it and
they told him that if they had it in their auction the
starting bid would be 100K. He also said the Smithsonian
wanted to buy it, but they wanted to display it for a year
first. When I asked why he hadn't given it to Southeby's
and let them sale it, he explained that he was on full
disability and if he came into that much money the guvment
(that's the way he said it) would stop his checks.
I asked him to send me some photos of it so I could
get the opinion of some experts tube testers I knew.
When I got the photos they showed a dirty, rusty,
60's vintage counter top drug store tube tester.
When I email the photos to some of the "experts"
and asked they what they thought the value of it would be,
they typical answer was $25-$50, IF you could find someone
that wanted it. They didn't.
That's really a difference from 100K that Southeby's
said it was worth...
There wasn't any GREED at work there, was there?

Ron

Hmmm, lets see. You spam newsgroups with "coming soon" auctions, then
with current auctions and then with "one day more" notices.
Why don't you make a list for maybe one month and just post it once?
Some of us get really pissed off about the constant reminders to "come
look at my stuff".
Just when did you decide that public discussion groups were your
personal corkboard for selling?

I'm not carping about posting ebay links - I'm carping about the manner
in which you're doing it as if I need 3 whacks across the head to look
at your stuff. Once is enough.

So now typical "non-collectors" are just stupid shysters with get rich quick dreams?

I don't "collect" (but I admittedly accumulate). I don't build special additions onto my home to house old radios. Am I a shyster? Can I not sell a humble old ham rig for the best offer? Can I not simply BUY an old ham rig and actually use it instead of parking it on a shelf for my kids to have to deal with when I do the final SK?

Ron, not everybody who enjoys old radios is a "collector". I respect your "collection" and the efforts you have made to have it but I resent your constant denegration of people who don't have the same interest. Last I heard, you don't even "do" post-1928 radios so I don't know why you're even commenting on this gear.

Lighten up for chrissake, willya?, and realize that everybody doesn't operate by your standards.

There. Now I've said it. My anti-caustic 1940s AA5 Bakelite flame suit works very well so have at it.

I agree. Depending on how long ago the father passed away, they may not be prepared to deal with this. They may have no one to turn to to get advice on prices of said equipment. They may be clueless as to what to sell it for. I know - I've seen it a few times. I know a lady right now who's husband passed away 10 years ago, she refuses to sell his stuff. She doesn't want to deal with it. They may not want to price it too high - as Dave said, fear of embarassment. They may be having a tough time just parting with it.

I know of a guy too, who makes it his business to go to Estates and gyp people out of equipment for pennies on the dollar, then try to get top price for it ONLY after he has screwed with it and messed it up. He is well known and many tend to stay away.

Give this guy the benefit of the doubt..... If he's posted no prices, offer him a reasonable price. I'm sure he'd consider it.

Source record: 17686

I have for local pick-up a very nice GRC-19A. The T-195A has the solid-state HV supply and I'll include a replacement LV B+ solid-state supply, ready to install. The T-195 does, however, need some tweaking of the servo loop (diodes in discriminator?). I was using it on 3885 (120 watts out) and moved to 40 meters, momentarily. The tuning is sluggish and would not fully resonate back of 3885. Other than that, FB rig. The R-392 is also in fine condition and without any problems, whatever. Included is a rack, dog-bone connector, and stock mic. Meters on the TX are replacement meters and work/calibrate fine. I'll also include some tech info (enlarged schematics, etc.). I have several spare PA module/chassis, so I'll include one of them, too. I'm located in Central MD.
$575 for the complete system or $275 without the R-392. The R-392 receiver is NOT available by itself. If interested, I also have spare PP-4763 power supplies w/ books that will run this rig (It won't run a straight dynamotor GRC-19, however) for an additional $95.

2599. Drake R-4b receiver sensitivity question.

Newsgroup: rec.radio.amateur.boatanchors
Date: 2005-06-13 14:03:39 UTC
From: cnoneicnjfsssss@hotmail.com
Message-ID: <42ad8e5f.1614161@127.0.0.1>
Source record: 17688

I was aligning a Drake R-4B receiver. When aligning the receiver sensitivity and the S meter the manual states to set the RF gain to read -15 vols from TP2 (test point 2). The manual states to set the meter to S40. At -15 volts the highest I can get my meter to go is S20. I replaced every tube in the receiver except the first RF amp, and the only reason I did not replace that tube is because I don't have one of those tubes at this time.
The alignment instructions for this section are on-line at;

http://www.wb4hfn.com/DrakeManuals/R4B/Manual_R4B_38.jpg

The full Drake R-4b manual with schematic is on-line at;

http://www.wb4hfn.com/DrakeManuals/R4B/Manual_R4B.htm

Any ideas why the S meter will not go to S40?

Does anyone know the dimensions of the Hallicrafters R-12 bass reflex cabinet? This is the large wooden console cabinet used with the SX-28. I have been contacted by a fellow who wants to build one.

Thanks.

Phil Nelson

And vernacularly referred to as "tropcial varnish."

It can still be found in spray cans, furnished even in more recent years to MIL repair facilities for touchup, such a SIMA's etc. That is, unless it's me looking for a can...

Bi-linear= amplified transmit and receive. IIRC, those receive amps were
about 20dB gain and noisy as hell.

You know... not just Lin-yer, but TWICE as Lin-yer... da
dubble-whammy-mammy-jammy-for-the-astute-hammy.

Either that or it is such a complicated abstract of the parallel linearity
of circuitry that a sane mind couldn't possibly comprehend it.

Last I learnt, them lin-yers was a dollar a watt, [being bird-watts of
course], so if that thing is a killer-watt, then it's half-price!
But don't laugh....
Right now somebody out there in skip-land is trying like heck to sell some
rottweilers and gold-triggers in order to buy that thing.

rb

Well said. I get a lot of email from people who just inherited or found something. They are not radio people. They basically don't have a clue and they're not trying to get rich. If I were willing to pay shipping for this stuff (which is often crap IMHO), I could fill a warehouse to the ceiling. Many of them are also not Internet-savvy, so you could earn some bonus karma points by giving them a break. In the last two or three years, I have gotten hundreds of "do you want to buy this" emails, and of those bought one, yes count it, one radio, a Midwest console that was within easy driving distance. For the rest, I advised the owners to contact the nearest radio collector club or make a nice donation to a local charity.

Lighten up :-)

This coming Sunday....

+++ Now even more Buyers Parking !!!
Thanks to TKT we have use of their new parking lot
across Albany St from the SWAPFEST !!!

!! ** More Buyers PARKING is available ** for details see
http://web.mit.edu/w1gsl/Public/flyer

*** !!!! In our Traditional GARAGE and the adjacent lot !!!! ****
so come rain or shine or super heat the Flea is on !!!

********* $1 buyers discount with hardcopy of this notice ********

COMPUTERS - ELECTRONICS - HAM RADIO - COMPUTERS - ELECTRONICS - HAM RADIO

FLEA all SUMMER at MIT
Sunday June 19th 2005
9AM-2PM

Come to the city for a great flea - plenty of free parking.

MIT's electronics and ham radio flea will take
place on the third Sunday of each month this summer,
April thru October.

There is tailgate space for over 600 sellers and
free, off-street parking for >2000 cars!

Buyers admission is $5 (you get $1 off if
you're lucky enough to have a copy of our ad)
and sellers spaces are $20 for the first and
$15 for each additional at the gate.

The flea will be held at the corner of Albany and
Main streets in Cambridge; right in the Kendall
Square area from 9AM to 2PM, with sellers set-up
time starting at 7AM.

SEASON PASS + Advance Seller Discount

A sellers discount season pass is available which
offers a 30% discount. By prepaying you get a
discount and earlier admission. See the registration form.

*** Attention Sellers ***
Prepaid vendors.. Season Pass or monthly,

will be admitted FIRST.
Separate lines will form prior to gate opening
for prepaid and nonprepaid vendors

!! RAIN or SHINE !! Have no fear of rain, a covered
well illuminated tailgate area is available for all
sellers (6'8" clearance).

Talk-in: 145.23- (PL 88.5) W1BOS/R and
W1XM/R-449.725/444.725 (PL 114.8/2A).

Sponsors: MIT Electronics Research Society
MIT UHF Repeater Association (W1XM)
MIT Radio Society (W1MX)
Harvard Wireless Club (W1AF)

For more info / advanced reservations 617 253 3776

Lighten up? Not Internet-savvy? He sure found his way here and the guys
question sure seems like a funny thing to ask with the best radio price
estimator of all time right at his fingertips "EBAY" It was easier to find
Ebay than it was to find this place and he knows enough about radios to
equate boatanchor with radio.

As vaguely recall the test point requires a very high impedance meter. I think the 11 megohm vtvm is what is normall used. Unless the meter used is high enough, it will load down the circuit and when removed, the negtive voltage will go higher thus reducing sensitivity.

But, I think it has been 10 years since I played with the R4B.

Heh, even the 2dB NF ones will push a front-end into overload,
worsening the overall NF by a good 30 dB ;-)

All Gear working last time tested unless noted. Shipping is extra. Please reply to my email address. Money Oders or Checks Ok. Will hold Personal checks until clear.

Thanks

Tempo-1: All Tube Ham Transceiver with Power Supply. Covers 80-10 meters. Looks good and works well. $150

Pearce Simpson: Guardian 23- All tube CB Transceiver/with mobile power cord and mounting bracket. Looks and works Good. $100

Swan 14X DC Power Supply Module: No way to test but was told it was working OK. As is $45.

Siltronix Model 90-6 VFO: Excellent condition with three position crystal switch $60.

Marantz Model 2220B: Stereophonic Receiver, with gyro-touch tuning, blue dial and optional real wood case. This unit is in excellent condition, both in looks and operation. I would rate a 9.7. Also have original manual, in excellent condition. $200

Channel Master: Tube Stereo Receiver (Model 6612) and matching amp (Model 6601) Looks good and plays on FM only. AM not working. $75

Traynor: Group Two B- Audio Amp Head. High/ Low misc. in puts. Master volume,
volume, bass, treble and tone shaper controls. All solid state $100

PRO 2003 Scanner: Radio Shack 50 channel(30-512 Mhz.) Digital Scanner with FM broadcast band included. Have two, one is working the other is a complete non working unit. $100 for both.

Bearcat 250 Scanner: Have two. One working at times and one for parts. $50 for both.

RS Pro 30 Scanner: Hand held 16 channel Digital scanner. Looks & Works good, but the battery cover plate is missing $20.

HTX-202: Radio Shack 2 Meter HT. Works good. Slightly chipped where the battery slides in, but does not affect operation. No nicad or antenna, but I will include the AA Battery pack with the unit. $80

I don't necessarily agree. Yes, many know of and use E-Bay to buy and sell. Maybe not all - think to use E-Bay as a "price comparison" given some prices ARE a bit outrageous. Let's face it, some folks put stuff up for bid at a starting price for a hell of a lot more than it is worth. That can NOT honestly be construed as a "guide". If the "price" can't be used as a guide, neither can the condition of some of the junk listed. His best bet would be to accept offers, or seek the help of local hams for selling his father's gear.

To give another example... "I" know of google, yet I have only used it maybe 3 times. Why? Because I really have no use for it. I can get a quicker reply often by asking those in the know - meaning "someone" on here, usually has an answer to a problem or question. So, would I or DO I recommend google to others? NO.

Everyone has their own reasons for doing or not doing things a certain way. Maybe this guy isn't "that" internet savvy - to trust or even use E-Bay. I'm not a computer whiz either. A lot of what I know, I learned by doing, not asking. Some things I learned pretty quick, others took me a bit of time. Not everyone is a computer whiz. Finding the news groups was not exactly rocket science for me, and most likely wasn't for him or others - either.

Personally, if it were me facing the scrutiny just for that basic listing, I'd say *&^k it and sell it at the first flea market I could get to. Nothing is worth that bull shit. Who knows, he may get pissed and just toss the stuff and someone could lose out on some otherwise top notch gear. These groups aren't exactly user friendly when it comes to helping "all".

Just my 2 cents.

L.

OK OK this was covered before but I ignored coz I never thought I would own a Hallicrafters SR-150.... but now that the Dallas HamCom Hamfest is over one followed me home right to the bench.

Got it working so now I would like to paint her.

So.... ahem.... Who's selling Halli Grey paint?

Next - Where can I get those darn two prong Amp mic connectors ???

Yes Yes, this was all covered before a few months back..... but who knew I woukd own one?

Moral of the story = never go to a hamnfest with a pocketfull of cash... just keep your hands in there and nothing else...

Thanks es 73

I will be in Ontario and Los Angeles, CA area this weekend and will have a lot of free time. Are there any good electronics/Ham stores in that you would recommend? Electronic Surplus stores that have radio gear/parts are a plus as well.

I have an internet connection at my hotel, so any responses anytime this weekend will be read.

Thanks!

I purchased a used Yaesu FT-101ee off of Ebay. When I transmit
with either a CW stright key or the microphone on AM the CW sidetone
comes out of the ft-101e speaker. Keying the CW key in CW mode does
not transmit. Whas there a mod for a Yaesu FT-101e that turned AM
mode in to sort of a code practice oscillator?

Is the mode switch a wafer switch by any chance? And is it damaged?

Russ,
There is a SCARS (So Cal Antique Radio Society) swap meet starting at 7AM in a parking lot at 1000 Isobel St. in Burbank if you are interested. Take the Burbank Blvd offramp to Victory (bottom of the overpass) . Turn south on Victory, go one block or so to Isobel and turn rt. The parking lot is on the left side. Enjoy, Mike KF6KXG

I'll pass. Actually it works quite well on sideband, and if I turn
the sidetone off on the inside of the radio the AM works. I'll
probably have it fixed in a day or so.

2665. Yaesu FT-101e PB1315B board parts numbers

Newsgroup: rec.radio.amateur.boatanchors
Date: 2005-06-18 13:53:23 UTC
From: whfkshfkshf@msn.com
Message-ID: <42b42628.12244817@127.0.0.1>
Source record: 17554

I was looking at the PB1315B audio board on my Yaesu FT-101ee, and it does not have the individual parts numbered. The transistors are numbered, but not the capacitors and what not.
Does anyone have a picture of the PB1315B board with all the parts numbered? In particular I am looking for C15 and other parts invloved in the CW keying circuit.

Thanks

UPDATE..

The CW tone oscillator does work, because if I manually key the radio
via the front panel MOX switch while in CW mode and then press the CW
key the radio transmits the CW tone.
Now I'm looking at the PB1315B audio board. On the schematic it
looks like the output from the CW oscillator (Q7) is fed to the input
of the vox amp (Q4) on pin 1 via coupling capacitor C15. VOX does
work in SSB mode and the mic audio is also fed to the VOX amp via pin
1, so the VOX amp is ok. Unfortunately the capacitors on the board
are not number, and staring at the traces has not revealed C15. I'm
wondering if the schematic I have is not the schematic for the audio
board version I have. Apparently Yaesu had diferent versions of the
audio board at different times.
Does anyone has a schematic for the PB1315B audio board?

-thanks

The more I look at the schematic and read the theory of opration the more I think it is the wafer switch. The CW side tone oscillator is only suppose to operate in the CW mode, but it only comes on in the AM mode. The output from the sidetone oscillator is fed in to the input of the VOX amp, so the sidetone oscillator also keys the radio when the CW key is pressed.
If I manually key the radio in CW mode with the "MOX" (manual transmit switch) and then key the CW staight key the radio trasnmits a CW carrier, but the CW sidetone does not come out of the speaker.
Only when I am in AM mode does the CQ sidetone come out of the speaker, and it will key the radio with VOX enabled in AM mode and the microphoen disconnected. Either one of the wipers in the wafer switch is off by one (CW is position 4 and AM is position 5) or the switch is wired wrong. Unfortunately the side of the wafer switch I need access to is facing towards the inside of the radio, and not towards the outside chassis. If I can can figure out how to get to that side of the wafer switch I might be able to fix it.

On the front of amp it reads: GSB-201 Mark IV. The Mark 4 amp uses (4)
572b tubes and (4) large block diodes for the HV P/S instead of small
diodes strung together to reach the high voltgage. Hope that helps. TNX

Hi Purr Plexed,
No, there wasn't a code practice mod for the
FT-101, however, there was a mod that allowed you to install an AM
filter in the CW slot, and its tricky to do if your not familiar with
close space soldering, and part identification. First, take a look at
your Crystal Filter Board, and see if there are two filters on the
board. If there are, remove the FT-101 case, and take a look to see if
someone has installed an AM filter. The AM filter would installed in
the CW socket if its there. I have seen alot of problems such as yours
from people not doing the mod correctly. If you do have an AM filter
installed, the first thing to do is pull the board, and look at the
back of the board. The board is in a plugin slot, and not hard to get
out, just eyeball it, you'll see how to take it out.. If you see two
.01 ceramic caps between the SSB and AM filter, remove them. It
doesn't tell you this in the service manual, but you must do this.
Now, here is the rest of the CORRECT way to check the mod to see if it
was done right>>

AM MOD FROM YAESU SERVICE MANUAL

Install AM Filter in the CW filter position. Wire mode switch S2C
as follows:

1. Remove the jumper between pins 1 and 5

2. Remove the banded end of diode D1 from pin 5 and solder it to pin 4

3. Solder a jumper from pin 3 to pin 2

4. Remove the yellow wire at pin 9 of MJ-3 which goes to the heater
switch SSB and solder it to pin 4 of S2C

5. Remove the yellow wire from pin 4 of S2C and solder it to pin 5 of
S2C

6. Remove the red wire from pin 1 of S2C and solder it to pin 1 of mike connector J3* - SPECIAL NOTE.. I have done quite a few of these mods, and have found that on some Yaesu sets, the mike connector is not wired the same. The red wire should go to the GROUND lug of the mike connector.

This completes the AM filter modification. The set will operate normal in the LSB and USB modes, and will use the SSB filter in the CW mode. The wide band AM filter will be switched into the circuit when the mode switch is placed in the AM position and the SSB filter will be switched out of the circuit. The only change from normal operation will be in the TUNE-CW modes. The mike pre-amp and amplifier stages will be turned on if the VOX switch is in the VOX position. Audio cannot be transmitted in the CW mode even though the VOX relay can be energized via the mike, but in the tune mode audio can be transmitted if the mike gain is turned up.

I also presume you checked both relays and assured none of the points are stuck or dirty or sequence incorrectly. OH, BTW, BEFORE YOU PULL THE RELAY from the PA cage, MARK IT, as it only goes in one way, and there are NO GUIDE PINS TO LET YOU KNOW HOW TO PUT IT BACK IN, and it will plug in either way.. Oh, and not only mark the plastic cover, once you take off the plastic cover, mark the relay itself, as you could also plug the plastic cover on backwards. Plug it in wrong, and the instant you turn the set on, you'll let the smoke out of your set.

In closing, I have scanned the whole Yaesu Service Manual into a .PDF (21 megs plus) document, and as soon as I can get over to a friends house with a fast connection I will up the manual to> http//mods.dk ... BTW, all of the above material is provided for REFRENCE ONLY. If you choose to use any of it, you do so at your own risk. I take no responsibility if you blow your radio up.. Best 73 es gud luck OM.. Anthony, WB8MLA

Nothing special. (You can use an octal tube socket for
the same purpose, cheaper!)

I have some weird double FT-243 crystals though.
Made for Uncle Sam, they house two crystals in one unit,
either a dual channel job, or one for the transmitter and
one for the receiver on the same channel.

Is Juns still open? It was on the road that runs N-S just off the east end of the LAX.. Sepulveda, I think... Was about 2mi N of the airport... west side of the street.

There was another store was close to, just north of, DL. I remember passing it heading south off one of the big highways. Was also on the west side of the street.

NC-190 RF coil slug stuck.
After repdressing some bad wireing, replaceing a couple incorrect value resistors, a 0b2 tube, removing some giant solder blobs, fixing shorts and replaceing the 5K volume pot with the correct 50k pot, the thing is working but not spectacularly. Trying to align it but one slug, T3, won"t turn. Any suggestions?

Is it a ferrite slug, with an internal hex/square/triangle hole for the diddle
stick to fit into?

-Chuck

It is a hex hole ferrite slug. The slug is not damaged yet but it has
rounded off my plastic tunung tool. I think the sleeve is plastic.Some fine
dust may have set up around the threads. The chassis was pretty dirty.

Hi John,

9 times out of 10, when a slug freezes that tightly, it is split in half along one of the points of the hex. The tool spreads the slug when you apply torque. The more torque, the more it spreads, and the more it spreads, the more it locks.

The crack is never visible to the naked eye, and is usually too far into the hole to see with magnification.

One way that I have successfully removed cracked slugs is using a round cocktail toothpick and a drop of yellow carpenter's glue. Put a drop of glue on the end of the toothpick, and insert it into the core and let it dry overnight. The next morning it should screw right out. Be careful not to use too much glue. It wouldn't do to have the core glued into the coil form.

Once you get the core out, pick the yellow glue off, and glue the halves of the core back together with water thin crazy glue.

-Chuck

2703. Original Manual for Knight R-100A Receiver

Newsgroup: rec.radio.amateur.boatanchors

I have for sale a couple of 2 Meter Mobile Transceivers cheap. One is an Icom IC-280 Mobile 2 meter, 10 watt Transceiver. It works well, comes with the manual, box, cable, mount. Price is $35 plus shipping. The other one is a very nice Midland 2 meter 25 watt transceiver. It comes with a mic and manual and power cable. It works great and looks almost new. However, the meter does not work. It does not move either on receiver or transmit.But this does not effect the operation of the radio. Price is $45 plus shipping. Neather radio has a Tone Board. Thanks, Charlie Hugg, K5MBX

I don't know if that's it but it sure makes sence. It has not moved at all
but I have felt the sleeve give slightly so I'm afraid to put any more force
on it. Even on the other bands the reception is not great so alignment might
not be the whole problem. Broadcast band seems good but maybe it's just the
strong signals makeing it seem better.

1932/33 McMurdo Silver 5C to be listed later (~9-9:30 PM CDT) today:
Extremely RARE and in working condition, a very nice McMurdo Silver 5C,
Super het of 1932/33 that was featured at the Science Exhibit at Chicago
Worlds Fair. BE ADVISED: if you are looking for a receiver that out performs
the likes of R-2000, HQ-180, etc, pse do not bid-have a nice day. This radio
is for the serious collector that appreciates such a exceptionally rare
antique. I copied SSB on 20 m and 70m this AM BUT I had only an attic
antenna so signals were not as strong as they should be. Covers 1.7-4, 5-12,
& 9-22 mhz. Mid-band is the 'hottest and 10 Mhz WWV is basically right on. I
received noise on 1.7-4 (ant?) but it is receiving a 4 Mhz sig generator
output quite well. Sensitivity drops on the higher band but receives AM
broadcast stations in the 18-9 Mhz region. Unpacked weight is 28 lbs and ~
34 lbs with the 11" speaker! I highly recommend professional packing, but I
will ship in a very large box for protection. FULL INSURANCE IS REQUIRED--NO
EXCEPTIONS. This unit is NOT MINT (which means NEW to me) and if I were to
keep it I would continue to make a few more corrections. It IS very clean.
All tubes check way beyond minimum. All shields in place though may not be
original. Front is crisp and clearly printed (repainted?). SPEAKER INCLUDED;
no cabinet however.Sounds great.
From: heytubeguy on ebay.

2710. FT: R-390-A for Icom 706

Newsgroup: rec.radio.amateur.boatanchors
Date: 2005-06-22 16:30:49 UTC

Message-ID: <1119457851.966242308214e2a4aab2a52fd465143b@teranews>
Source record: 17499

I have a recently restored R-390A that I would like to trade for an Icom 706 (don't need a PS). The 390 is missing the ID tag but is assumed to be Stewart Warner as that is the manufacturer of the tuning unit. It has all filters installed and working, it has been aligned and exceeds original specs, PTO tracking is good, caps have been replaced. The front panel was stripped and repainted the original color (light green). It is an engraved panel and all lettering was filled in. The tube shields (black with inserts) are there and both covers as well. Both correct meters are there. Looks and plays great. Located near Philadelphia.

Any takers? Please respond direct.

All of the below (good, clear info, BTW) is exacerbated by the cellular companies pushing wireless imaging, data transmission and (god forbid) streaming video...instead of concentrating on their core service: giving us intelligible, reliable voice transmission.

How many voice channels will have to be sacrificed to provide one channel of streaming video?

Message-ID: <%Roue.8015$NX4.1725@newsread1.news.pas.earthlink.net>
Source record: 17507

Electro-Voice - TenTec founder dies
Albert R. Kahn, inventor and audio pioneer, was 98.

CASSOPOLIS (AP) -- Albert R. Kahn, an inventor who co-founded Electro-Voice Inc., a pioneering company in audio technology, has died. He was 98.

Mr. Kahn died of pneumonia at his Cassopolis home June 15, according to Connelly Funeral Home.

He was born July 9, 1906, in La Salle, Ill., and moved to South Bend in 1912. He lived in the area near the Michigan-Indiana border he rest of his life.

According to Electro-Voice's Web site, Kahn and local machinist Lou Burroughs founded a radio service shop in the basement of Century Tire and Rubber Co. in South Bend.

Three years later, they developed a portable public address system for Knute Rockne that allowed the legendary University of Notre Dame football coach to simultaneously instruct his players during drills on four adjacent fields. Rockne called the system his "electric voice," and Kahn and Burroughs changed the company's name to Electro-Voice.

The company invented the stereo magnetic phono cartridge in 1957. Six years later, it received the first Academy Award ever given for an audio product.

Kahn was president of the company from its founding until 1969, when Gulton Industries Inc. acquired it. In 1970, he co-founded radio equipment maker Ten-Tec Inc. in Sevierville, Tenn.

His wife, Anne, died Oct. 4, 2001. Survivors include three daughters, nine grandchildren and eight great-grandchildren.

A memorial service is planned for July 16 at the Diamond Cove Missionary Church in Cassopolis.

Yes, I saw the Japanese site.... had an FM/AM broadcast radio circuit.
I suppose I could work with their circuits, but I was looking for a design
that was already closer to my needs (CW detection). Another reference to
"superhet" circuit was a dead link, for me. It looks like my best chance
to find what I'm looking for is to try to find those back issues of QST
which were referenced.

Someone is offering to sell me a Collins 51S-1 general coverage receiver, a "winged emblem" model.

I'd be interested to hear how people would compare it to similar-quality receivers. I can read the specs in the Osterman book, but what is it really like to use, and how does it stack up against others? Any quirks, PITA characteristics, standout features, etc.?

And, assuming it's in average condition, what would be a fair price?

My suggestion is that you get out the Sam's Photofacts book on car radios and look at some of the vibrator-free tube car radio designs. It should not be too hard to change the loopstick and/or tuning cap for 75M and 40M.

The problem you'll have is that the IF is wide as hell, but that's part of the fun. Be sure to add a BFO!

Phil, Having been through several 51S-1's and S-1A's (still have one), I'd say the going would be $500-$1200 depending on condition. Is it in a case or is is a rack mount job? How well does the PTO track and what's the condition of the crystals (can you calibrate each band and band edge? Changing an out-of-spec crystal can be a noteworthy mechanical challenge. As far as operations go, its a fairly decent receiver. I think that a similar condition R-390A would be a better way to go, but maybe physical size of of concern? Parts are quite scarce, should any be needed in the future. But, if the unit you're being offered is clean, up to spec, and you're a Collins aficionado, there are far worse things you could do with your money....hi!

Phil,

(The last time I played with one was about 20 years ago). It's a state-of-the-art 1960s-era _communications_ receiver for SSB, CW and the kind of intentionally bandwidth-limited AM used for communications years ago. As I recall, it was a lot more expensive than the similar Collins amateur radio receivers, but some hams liked to have SWL capabilities (as I did). I believe the main customers were the military, embassies and commercial point-to-point communications stations. Its definitely a lot easier to tune than an R-390, the dial is very smooth and nice.

For MW or SW broadcast listening, you can tell that the AM bandwidth is limited, and, at least for me, the fact that the tuning is broken up into 1 MHz bands, is a bit of a nuisance. Also, below about 2 MHz, it can really use the matching preselector to give it more gain (the lower bands are upconverted).

I'm not sure about serviceability, but Collins equipment can be tricky to work on. Somewhere I read that some people refurbishing these receivers have replaced some of the local-oscillator crystals, and perhaps the calibrator crystal to make the calibration more accurate. Not sure about other components that tend to go bad.

I've seen a 51S-1 offered for $1100.00 this year -- according to another listing the used price is in the $1100.00 -$2100.00 range.

12V plate tubes are rather rare, perform poorly compared to most anything else. They are very low power, low gain, and low frequency. Typical amplification factor is 10 or less. With the exception of the R392, which used 28V tubes, and some automobile radios from the late '50s to early '60s, I don't recall that they were used for much of anything... which is why they are rare.

There were a whole pile of different types made, pentagrid converters, sharp and remote cutoff pentodes, triodes with diodes, pentodes with diodes, twin triodes, ... the most amusing thing was the "power" tubes that had maximum output ratings of 20mw!

The typical automobile radio used the following tube lineup:

RF: 12AF6 - Sharp cutoff pentode
Mixer: 12AD6 - Pentagrid converter
IF: 12AF6 - Sharp cutoff pentode
Det/AGC/1st audio: 12AE6 or 12AJ6 - medium mu triode/ twin diode
Audio amp: DS-501 Delco Germanium PNP transistor.

In a car radio, the RF/Mix/LO was tuned by a very fancy rig that moved the slugs in the coils. The IF was 256KHz, with a 4KHz bandwidth...Real Hi-Fi!

Somewhere in my archives I have a Sams Photofact for the 12V tube radio that is in my '60 'vette. By 1960, all transistor car radios were already on the scene in Corvettes and Cadillacs.

In the R392, the 28V tubes in the RF section are generally bad, and kill the sensitivity of the radio above 14MHz.

Is there a particular reason that you want to use this style of tube?

Today it is trivial to make a simple switching power supply that can provide a couple of hundred volts at 98% efficiency, why not make one of them, and use some real tubes?

Many years ago, I traded my 51S for an R-390A, and it was a weird sort
of step.

For pulling SSB and CW out of the muck, the R-390A beats the 51S hands down,
so many different ways it's not funny. Signals you never thought you'd
be able to copy really pop out with the mechanical filters on the R-390.

But the audio on the 51S beats the audio on the R-390 hands down, also.
If you want to listen to AM shortwave broadcasts or join the 40M AM
crowd, and you care about weak signal performance but not about the
ultimate in selectivity, the 51S is a pretty fine receiver and I'd pick
it over the R-390.

I miss mine sometimes, especially for MW DXing.

That's why Sherry has the best of both worlds - an R-391 with a 390A IF
- which can be swapped out with it's original 390/1 deck in few seconds.
The /A IF is great for copying RTTY - the original IF is much better for
cruising the bands. It's an option anyone with either radio (non and /A)
can do...

best regards...

The problem I've encountered with switching supplies is that they're so
blasted noisy because of the fast risetimes in the high-current parts
of the supplies and because they're usually not very well shielded and/
or decoupled.

But given the topic, I'm always surprised that people don't treat switching supplies like those cars of old. Look in the old ARRL mobile manual (and a later edition just might have a receiver using those 12v tubes), and there was always material about filtering the alternator noise.

Make it go through feedthrough capacitors, put in tuned circuits in series with the 12V (to null out the whine), and good shielding. These are the things that apply to switching supplies, though too often they are so treated as black boxes that nobody considers such things.

As for 12v tubes, you most certainly saw converter using them. SOmeone was asking about 12v Nuvistors a while back, and the next to last edition of the ARRL VHF Manual, late sixties or so, has a converter using one.

We are not talking about normal radio tubes that have 12V heaters, we are talking about special tubes that have 12V heaters, and a 30V maximum plate voltage rating. These special tubes were designed to use normal car battery voltages as their plate voltages.

If you make it yourself, you can apply proper shielding and decoupling techniques.
It is done all the time in commercial radios. For a small receiver like is
being discussed here, the supply can be made in a couple of cubic inches...
Something that can be easily made in a soldered shut can with feedthru's on
all of the leads.

Philips produced a number of low-voltage tubes,such as the DAH50, A221 and A441,
in the '20s and '30s that people built successful radios with.
A few people have experimented in recent years with using normal tubes at
low voltages, try googling for "space-charge tubes".

2733. Re: Opinions of Collins 51S-1 receiver?

Newsgroup: rec.radio.amateur.boatanchors
Date: 2005-06-23 18:19:39 UTC
From: Edward Knobloch <alias@nowhere.net>
Message-ID: <%2Due.2491$c97.1204@trndny07>
Source record: 17522

Hi,

I bought a used 51S-1 about 15 years ago,
and it arrived with a burned-out antenna coil
for the 7 mc band (strange that the seller didn't notice that...)

All of the band change components are mounted on fiberglass
sections of a ten-section turret switch. To get at the parts
for repair, one must first remove the shaft of the switch,
and then the individual switch sections can be removed.
I'm mechanically somewhat ham-handed, but I managed it OK.

The 51S-1 seems a bit more stable than the 75S-3C,
I think because the PTO is not switched
to maintain dial calibration for USB/LSB operation.
Instead, there are two separate mechanical filters for USB
and LSB, and the BFO itself stays crystal controlled right at 500 kc.
The sideband mechanical filters are broad, about 2.8 kc,
and the c.w. crystal filter is 800 cycles bandwidth
(no variable BFO is included).
A.M. reception is via standard IF transformers,
with only about 5 kc bandwidth.
Collins offered an optional 6 kc mechanical filter for A.M.
They also offered optional 2.4 kc SSB mechanical filters,
and a 300 cycle c.w. filter.

The agc action is not that great, and the S/meter drifts a lot
in my unit - one of these days I'll get annoyed enough to track
down the source of the S/Meter drift. (+not+ caused by gassy
if/rf amplifier tubes).

Below 2 mc, the receiver is deaf without the (very scarce) 55G-1
low frequecy preselector.
Audio quality is pretty decent, and SSB is very
pleasant listening, if QRM is not a problem due to the bandwidth.

Selectivity before the first mixer is outstanding, based on the use
of double-tuned LC circuits before the rf amplifier.
If you connect the receiver to a random wire antenna,
you may be disappointed, because the receiver
really needs a 50 Ohm antenna system due to its front end filtering.
On occasion, I've used an E.F. Johnson TR switch between a random piece
of wire and the receiver input (it acts as a cathode follower
with 50 Ohm output), and the set-up worked very well.

The main tuning knob turns freely, so it is a good band cruiser.
There is a bit of clackity-clack audio noise while you tune away,
due to the turns counter which keeps track of which part
of the 1 mc band you are tuned to.
The PTO dial is marked in 1 kc increments from 0 to 100 kc,
and the counter display may be read 07.2 mc.
The tuning rate is about 30 kc per revolution.

In summary, the 51S-1 is a more than competant receiver,
with no really flashy features.
It doesn't give the operator much flexibility -
no variable BFO, no choice of SSB bandwtdths, AGC fast/slow, etc.,
so a knob-twister like me has nothing to do but listen
to the other ham (a daunting prospect!).

73,
Ed Knobloch

OK, good info in your reply, Chuck. My reply to your question (above) will probably elicit a whole lot of comments. I hope they're not too negative! HI HI

I am recently retired, and am about to have some extra time on my hands for some construction projects. With the re-surfacing of an old news item about terrorists or certain nations who may attempt to launch a nuclear EMP strike on this country, I was thinking about an old project I had once wished to start many years ago; That is an EMP proof ham rig for 75/40 .... probably CW only, for simplicity sake.

So I'm thinking of building a fairly simple tube rig, preferably superhet Rx, with tubes that will run totally on a 12V supply. Assuming that we never have such a terrible thing happen to us, a rig like this would still be fun to use. Following the building of a Rx, I'll probably build a simple one tube TX to match.

Ed

The QST Mobile Manual has a great project transceiver. The transmitter
is rockbound and based on a 1J6G tube, but it really gets out well. The
receiver I never built, but it didn't look like a bad design.

This thing WILL require a substantial B+... I think it needs a 67.V
battery. But you can put a few 9V radio batteries in series if you
really want.

Or you can build a vibrator supply. I think the Mobile Manual has an
article on vibrator designs as well.

The space-charge tubes are lousy... they worked well enough for cheap
car radios, but they never worked all that well. You can do a lot better
with a conventional tube design.

Hi Ed,

I would put the probability of experiencing EMP in our life times at
somewhere around zero, but that isn't a good reason not to proceed down
the path you are intending to travel.

The IC manufacturers suffered a wakeup call back in the 70s when things
were pretty hot with the cold war. It became a commonly held belief that
virtually all of the electronic devices in the country would fail when faced
with a nuclear attack. So, a hustle was begun to harden all of the IC's
against EMP. It turned out to be pretty easy to do. All they did was
redesign the pads, which are specialized circuits that connect to the outside
world, so that they could safely absorb the EMP. It had a beneficial effect on
static electricity survival too! So, if you do a good job of keeping the
EMP from coupling in through large antennas, power connections, etc. The

IC's pads should be able to do the rest. Power FET's are similarily protected, so they should be a good bet in an environment where EMP is a possibility.

If you are planning to make a transmitter too, you are going to find that the 12V tubes aren't much help. There are a couple that are called "Power amplifier" tubes. Despite their encouraging name, they were not designed to provide more than about 20 milliwatts. Their purpose was to go between the detector/preamplifier tube, and the DS501 power transistor that was used to drive the speaker.

As to designing with the 12V tubes, that shouldn't be a big problem, they behave very similarily to normal tubes. The big issues are high plate resistances, low gains, and low power levels. There is a group of antique military radio collectors that want to play with their radios, but don't want to recap, or permanently modificy the radios in any way. They have done extensive experimentation with running military receivers with plate voltages down around 28V. Their reasoning is that even the worst electrolytic will still perform OK at 1/10th of its normal operating voltage. The radios play...weakly.. but they play.

-Chuck

> pads should be able to do the rest. Power FET's are similarily
> protected, so they should be a good bet in an environment where EMP is
> a possibility.

During the 70s I did notice a lot of IC & FET failures in various communications devices that were attributed to static electricty. I was under the impression that the manufacturers had improved their designs for that reason? On the other hand, doesn't really matter, I suppose, since the end results help for both cases.

I'll probably continue my research on this project and start it this Fall, if for no other reason than the fun of it. From what responses I'm hearing to my original question, I'd be better off using conventional tubes over the low voltage designs. I did want something that would function off a 12V battery, though. We'll see....

My thanks to all.

Hi
I have a 32V-3 and it works great with the D104 non amplified
microphone. I have a RCA 77DX microphone I wired up to it and people
hear me but low?
I have the modulation knob all the way up and on the modulation meter
no movement? How can I get the microphone to modulate louder?
Thanks....Rich

Ummm a little something called impedance mismatch.

The output of the 77DX and the 104 are both about 0db @1 Khz
(http://www.coutant.org/3.html and
http://www.ronharter.com/astaticD104.htm)

However, the output impedance of the 77DX is low. Depending on which tap is
selected onthe onboard matching transformer .
The D104 has an extremely high impedance - on the order of 1 megohm.

You need to match 250 ohms to about 10k with a line to grid transformer.
Perhaps an Astic LT-6 or similar
(http://www.sbszoo.com/ve6sbs/sale/xform-aud.htm)

I am looking for a working unit in good (or better) condition with the power supply.

Due to weight, I will pick up in Michigan, Indiana, Northern Illinois, Northern KY, Ohio or Southern Wisconsin. Also may be able to pick-up in S. or N. Carolina or W. Va within 2 weeks.

Please e-mail me with any pics, condx. & your asking price.

Tnx

Terry

Phil,

The engineering and construction of this unit is quite unlike anything you currently possess. It uses a crystal controlled, permeably-tuned front end for tuning, which makes for a VERY stable receiver and a dial that is deadly accurate. This is one of those things where the mechanical engineering is every bit as marvelous as the electronics. The quality of everything is really first-rate.

PITA factor is pretty high on this, as it is on most Collins gear. The complexity is daunting if you have not dealt with one of these before. You will need to check all the crystals and replace at least some of them, as they age and drift a bit off-frequency over the years. In extreme cases, a turn may need to be taken off the oscillator coil because it changes characteristics as it ages as well. The resistors will all have to be checked and the the out-of-tolerance ones replaced. The audio output tube is run VERY hot on this rig-in fact, it is running about 20% above its absolute maximum rating! Some people like to modify the output circuitry to bring it down-to-earth a bit.

All that being said, this is an outstanding receiver. If you can get it for a good price, it is worth it just for the experience of owning one.

-Scott

I am surprised they hear you at all.

>I have the modulation knob all the way up and on the modulation meter
>no movement? How can I get the microphone to modulate louder?

First make sure the mike is strapped for 250 ohms. Secondly, put it
into a preamplifier with about 20 dB of gain.

That mike is WAY too low-output to plug into a communications mike jack.

It is also great for holding down mountain tops in high winds. I had the use of one for daytime work and nighttime hamming in 57 or 58. It is a terrific unit. Someone with a GPS90 receiver should buy it - they are a beautiful pair.

Try eBay, look for parts sellers located in Great Britian. There
are a few supply houses that specialized in AR-88 parts, these
sets were lend/lease, and most of them ended up in the European
Theater during WWII..

2759. Need schematics for 2 Heath products

Newsgroup: rec.radio.amateur.boatanchors
Date: 2005-06-25 02:40:23 UTC
From: lennyw@gmail.com
Message-ID: <1119667223.657314.153150@z14g2000cwz.googlegroups.com>
Source record: 17448

Hi

I've got 2 hot hamfest finds so far this season and need documentation
both of them. If you have leads on schematics or mauals, I'd appreciate
hearing from you.

Here are the items:

1. A Heath HA-201A 2 meter fm amplifier. A schematic would allow me to
figure out how to re-bias this amp for linear service. Please note that
this is quite different from the HA-201 (without the "A" suffix) for
which there IS documentation at the BAMA site.

3. A Heath IB-1102 nixie based frequency counter. It's currently in
working condition but it triggers poorly at high frequencies. A
schematic / manual would allow me to re-adjust it / modify it for more
reiable opearation at > 100 MHz.
A kind member of rec.radio.amateur.eqipment was able to get me a
schematic for the similar IB-1101, and it will help some, but one for
the IB-1102 would help more !

The commercial sources for documentation on these 2 items are
asking very high (way more than the cost of the items themselves)
prices for the paper work.

Thanks in advance for any leads.

73,
Lenny W2BVH

the radio by the way now works with good sensitivity down to 30mhz!!
now to tackle the ar88lf and the grey (navy?)ar88d

**** AR88 is identical to AR88D (with some small variations-see below),the 88 was intended for rack mounting,the D stands for "Desk" and indicates the addition of a cabinet.If the receiver is marked 88D then it originally came with the desk cabinet from which it has become seperated.
If what you refer to as an 88D is originally grey in colour,it will most likely not be an AR88D.You would have to ID all the control knobs,their layout and their nomenaclature .There were some variants of AR88 which had an additional front panel control,these were part of DR89 Diversity Communications Receiver
There are several variations of the 88 family,some are :-
AR88,AR88D,AR88F,AR88LF,CR88,CR88A,CR88B,CR91,CR91A and so on without mentioning some of the military equivalents (or sub variants of their own type!!) The CR prefix refers to "Component Radio" as in "CR88A is a sub component of DR89A Diversity Communications Receiver".
Let me know the front panel layout and frequency coverage,I'll look it up if I can (a picture on alt.binaries.radio will let everyone have a look).And,sorry,I can't help you with the knob.
Brian Goldsmith.

You probably lost a capacitor in the AGC system. Follow it from one end
to the other, and check all of the capacitors and resistors you find.

Not exactly.

On HF, it is fairly unusual that you can hear both sides of a conversation, unlike VHF where if I can hear one station, I can usually hear the other. So when I want to call someone, I listen first. Hearing nothing, I send QRL? (or on phone, "is this frequency in use"). If the station I can't hear gets my QRL, he sends C and I go off looking for another frequency.

Very few, if any, digis actually listen first. Even if they did, they don't have a way to say "Is this frequency in use" and understand the response. And even if they could, they really don't have the opportunity to change frequency, since they need to call on the frequency that the remote robot is listening. It seems as if it would be very difficult to make these automated stations be friendly to other users.

That being said, it looks as if Winlink 2000 is going to be come a significant part of our emergency response, which is one of the reasons we have access to these frequencies to begin with. We should be looking at reasonable solutions, perhaps developing new technologies to enable this sort of capability, rather than just flaming.

Both the pro and con in this argument are absolutely unwilling to listen to/believe the other side. We amateurs need to get our act together and figure out how we can expand the use of a technology like Winlink 2000 without making these automated systems even more of a nuisance than they already are.

I think it's about time to bring up the old "tuning wand" idea
again for the new guys. A tuning wand is a plastic rod with a
piece of ferrite on one end and a brass slug on the other. The
idea is to insert the wand into a coil and see if the output
increases or decreases. The brass end reduces the coil inductance
and the ferrite end increases same. If the circuit is tuned
correctly, inserting eaither end will cause the output to drop.
No sense trying to remove a broken slug if the circuit is tuned
Ok as it is.

73, Roger

There's plenty of space. We just don't manage it worth a darn.
If you listen to the ham bands, you'll find that the
vast majority of our allocation is wasted. For instance:
you could put every CW QSO during Sweepstakes into about 75 KC of
spectrum and have lots of elbow room.
For phone, probably 100-125 KCs would be a big plenty.
People want their freqs to end in "5" or "0" and that
is just poor spectrum management. Look at ten and six
meters, even at the peak of the sunspot cycle;
90% of it is empty, wasted space.
Every major city has 100+ repeater pairs allocated,
twenty or thirty repeaters on the air and maybe *three*
that get any sustained use.
That's pitiful and a matter of *ego,* not communication.
75 meters is "crowded" only because of our 5-n-10 KC mindset.
Our problem is ego and "we've always done it this way,"
not a lack of spectrum.

We're going to either make room for new and enhanced
modes or we're going to be swept aside like blacksmiths
and locomotive boiler makers, guys.
The times is passin' us by....

Well.... first things first, of course.. why are we always posting such discussion in all these groups for commerce?

Second, and I quote.... "Whatchu talkin' 'bout Willis?"
> If the station I can't hear gets my QRL, he sends C and I go off looking
> for another frequency.
<sorry to whoever posted that. :-) >

I would normally bypass these things but I've been thinking about getting another HF rig lately....and I've been considering why I keep selling them off, trying to warrant a purchase again. I'm thinking it has to do with the words "purpose" and "use".

So, I'm looking at getting back into it and doing something besides setting up a radio and just randomly playing with it or gluing the vfo on some nonsense gathering place.

So here are my questions and observations for your perusal and general flaming.

From the original link posted:

That the HISTORICALLY HIGH LEVEL OF INTERFERENCE BY PACTOR STATIONS to everyone else has demonstrated time and time again that even the operator-controlled Winlink Pactor stations don't care if a frequency is busy (because they can easily take it away), in their passion to get their email from the Internet, so they MUST NOT BE ALLOWED to mix with hams trying to COMMUNICATE WITH EACH OTHER!

Q: Someone please take a minute and point out a single coherent thought or plausible point in the above statement. Bearing in mind that tuning to any random freq can find people squawking over each other like the noise in a crowded room, or a CW freq sounding like my kid running down the "try me" aisle in the toy dept... When did it become impossible for my station to hear 2 other stations that can't hear each other?

Next, from the original link posted.

That ham radio is a HOBBY, not a quasi-commercial email "service" as Winlink provides, and that ham radio, from the very beginning, has always been mainly about hams communicating with other hams, and not about being used for unattended email gateways to the Internet, mostly for a few sailors, because the FCC Maritime Radio Frequencies were set aside for that purpose and are underused.

Observation: If it serves a legitimate purpose and assists a single sailor, military or civilian, it serves a greater purpose than your latest blathering, contest, or quasi-award. The author can 'pucker up and plant one' on that statement. Again, if it is a ham station to ham station, WHERE is the plausible point?? ..... I think I hear a tiny voice yelling "ME, ME, ME... I shall rule the world!"

Also from the original like posted:

That all unattended wideband digital operations, of any type, MUST be confined to the current sub-bands for automatically controlled digital stations, and not allowed to use any frequency they wish just in order to avoid having to wait a short time for a clear frequency in the sub-bands.

Observation: I think SHOULD is a better word. Also take the entire point and reverse it, maybe they feel the same way in a crowded band. Why can't YOU wait a short time for a clear frequency?? [I shall rule the world!!] Also, if you [and Winlink, and Amateur radio in general] wake up and smell the ALE, then you again have a moot point.
If you've ever been on a radio, you realize that attended or unattended matters not; due to world dominators. The problem you're having is with courtesy, not digital ops. Good luck freeing the world of jerks and morons. [and from experience, a dense population infiltration such as the one in ham radio would be a good place to point yer scattergun when you start.]
There's lots of people with lots of free time to build up their personal anger levels for whatever reason, then look for a [safe] place to vent frustrations.
It's the same with the www.
Also, if you paid any attention to Riley at any point, you'd know that he already said APCO25 is fair game on the phone bands, so you are actually showing up on Saturday for the Friday night fights. Sorry you missed us, but thanks for coming out.

And again from the link.....

To stop this attempted takeover, *[I WILL START MY OWN]*
EVERYONE ELSE needs to vote NOT to agree to the Winlink request, so ARRL does not get the wrong impression that the "majority" of hams want to sacrifice the frequencies they use for communicating, so that the less-than-1%, that are Winlink users, don't have to wait longer than 90 seconds to receive an email on HF or can't send picture attachments to the Internet.

Q: STILL trying to understand why he keeps saying "stop hams from communicating so that hams can communicate!" and "I'm not gonna wait 90 seconds on a bunch just because they can't wait 90 seconds!"
You know what... I think Winlink has something wrong....maybe... there're WITCHES!! Everyone chant and point at Winlink... "witch, witch, witch...."
Come to think of it... that pesky ECHOLINK is still going on too! Where's my echolink pitch-fork? C'mon, let's get 'em! Bunch of internet-connected morons sucking up my drivel time... LET'S GET ON THE INTERNET AND COMPLAIN, ESPECIALLY IN ALL THE PLACES WE SHOULDN'T BE! Hahahaha.... this is too funny.

[NOTE: If the author wants real results, he should get on Winlink and email his concerns to the Winlink users... that will complete his hypocritical circle and restore balance to the universe.]
Also,
IF THEY CONSIST OF LESS THAN 1%, HOW THE HECK ARE THEY IN YOUR WAY, BUBBA??
All you want is to have your 100%, right? Why can't people just understand that? It's a mad, mad, mad, world...

Researching the author, I see he is a QRP fan.... leaving me to wonder.... WHY would he want to purposefully limit himself to barely enough power to communicate when he has available a perfectly good 50-100w radio market?? That will give him plenty of power to be heard and not too much to drown anyone out.
I'm betting he operates QRP wherever he wishes, forcing others to WAIT while the do-good folks "give in" feeling sorry and letting the little guy have the time/freq.... what a power rush that must be.
Then again, it could be that he's simply experimenting and enjoying the hobby in the fashion he CHOSE by right, etc....
Nah, couldn't be that.

Before anyone jumps on that, be advised that I've already experienced the common orations on the post-nuclear advantages of QRP training. Here's a news-flash boys... after the smoke clears, your QRP station will either be lost in the new and improved noise floor, or be one of the new big-guns on the suddenly quiet bands.... so I still miss the point. But do I make a hole for you when I hear you? Yes, I do. [Refer to that courtesy thing mentioned above.]

Also, if anyone wonders/cares, I have few "friends" on the local repeater too, since I only use it for communicating when a telephone isn't suitable, or whatever the rules suggest.
Curse me for using simplex instead of the repeater most of the time! See, I had this stupid idea, that the repeater is only useful to me when the communication requirements exceed simplex range. I must be a fool.
It seems that contacting my wife on the repeater [preceeded by paging tones to my alert monitor...OMG!!!] then making my contact, passing necessary info and clearing the frequency is just absurd to the local jaw-breakers who inevitably pounce on any break in the silence, almost demanding attention. How rude I am for not sitting in my hot car in a parking lot for an extra 15 minutes every time I need to tell someone something simple and move on.

Don't get me wrong, I love to chat, ragchewing on a repeater [or HF] is no problem to me, but not every time I key a mic for goodness sakes! But, I digress...

I had a bumper sticker one time.... "I love Jesus, it's his groupies I can't stand.", and I wish I could find an analogous "I love radio, it's the operators I can't stand."

So, with my failure to "get it" along with my apparent stupidity, I now relinquish the floor to whomever.
rb

2778. Pizza, New Great-Circle Plotting Program

Newsgroup: rec.radio.amateur.boatanchors
Date: 2005-06-25 22:12:13 UTC
From: K7JEB <k7jeb.remove.this@qsl.net>
Message-ID: <90lrb1p949i59dv4la1bdm5lnid1tk74tq@4ax.com>
Source record: 17467
Cross-posted to:
rec.radio.amateur.antenna;,rec.radio.amateur.boatanchors;,rec.radio.amateur.dx;,rec.radio.amateur.space;,rec.radio.shortwave

A friend of mine, Jim Tonne, WB6BLD, has written a much-improved, Windows version of a classic great-circle plotting program and is providing it to the Amateur Radio community FOR FREE.

If you are a DX'er and need an antenna-bearing aid or just like to poke around on the earth's geography, this program will be of interest to you.

It calculates the bearing and distance from a Home location to a Target location anywhere in the world and displays this result on both azimuthal (polar) and rectangular maps. Both the Home and Target locations may be selected by mouse designations on the rectangular world map or chosen from a menu of cities, countries and callsign areas. The Maidenhead grid system is fully supported on both data-entry and readout. Sun and terminator positions are plotted on both maps in real time from the host computer clock, enabled by a menu selection. Both maps use an accurate, high-resolution, up-to-date geographic database. The azimuth map may be plotted at five different resolutions, allowing an optimum mix of accuracy and computation speed. Additionally, the azimuth plot may be repeatedly zoomed-in or out by a factor of 2 to place both Home and Target on-screen. Bearing and range overlays are provided in the azimuth plot, making it suitable for a printed-out beam-heading chart.

Both the polar and rectangular plots are printed to the standard Windows printer, no special drivers are needed. System requirements are a Pentium processor (P4 recommended), Windows 98, ME, 2000, XP, and 4.8 Megabytes of free disk space.

The download installation file size is 2.5 Megabytes. The program download URL is:

http://tonnesoftware.com/pizzadownload.html

There are other programs out there that perform this same calculation, but none with the combination of features Pizza offers.

Oh, yeah, that name. Bring up an azimuth plot of the
entire world and it hits you in the eye like a big
pizza pie -- that's amorï¿½!

Jim, K7JEB

I'll be 60 in January...dammit. I turn around in my chair and things simply disappear. I used to get very upset about it, but now I just say, "It'll turn up someday." and carry on, if I can live without it. The intensive searching will never find it if it's hiding from me.

I have to have my little cellphone, but that's easy to find after I get my neighbor to call it until I answer them.

I found one of my combs, the other day. It had been "missing" for 3 weeks. I asked it how its vacation was, but got no answer....yet....(c;

Hi,

Way off topic, but these boatanchors won't do us much good
if we forget how to use them.

On June 20, AP reported on a Dutch study of folic acid
(one of the B vitamins). Taking 800 micrograms/day
(twice the U.S. recommended daily dose)
for a sample group of about 800 people 50 to 75 years old
resulted in tests of memory equivalent to those 5-1/2 years younger,
for the group given the folic acid instead of a placebo.

The pills are cheap, about $4 a hundred at drugstore.com.

73,
Ed Knobloch

Can anyone help out with data on an Ajax A25 trawler radio? Searches come up with little information about this manufacturers sets, the only reference I can find being to an earlier set, the A20.

Any information gratefully received.

Tnx

I have a very nice Collins 516F-2 Power Supply that has been gone through and modified by Bud Whitney, K7RMT. It has one of Bud's stickers on it dated July 19, 1997. It has been used only a few times since then. The SN is 14788. Mods include Solid State rectifiers, Power On/Off Relay, raised high voltage tube socket, some new capacitors, and other mods that are part of Bud's Power Supply Update. It works perfectly and looks great. It comes in a very good to excellent Collins Cabinet, your choice of Round or Winged.Price is $575 plus shippng from 79602. I have too many Power Supplys and need to part with this some of them. Also, I have for sale a stock Winged 516F-2 Power Supply in very good working condition for $350. Thanks, Charlie Hugg, K5MBX, CCA #307

I went to Wendell's web page to check out his replacement meters, and found the notice of his death.
For those of you that didn't know Wendell, he was the last remaining Hickok authorized tube tester repair man. He worked on testers and old equipment for most of his life and was a wonderful man. He provided free info, pep talks and general knowledge about radios and tube testers to anyone who called. Wendell was a nice man and a great tech, he will be missed.

I recently got the subject receiver in good conditions. I have re-checked everything (including tubes) and accurately tuned it.

It works very well on all band up to 20 meters. On 15 meter and 10 meters it works fine, but it is comparatively less sensitive. When tuning trimmers and coils one can see a clear signal peak, so it does not seem to be a problem bound to a resonating circuit off resonance.

I measured that the signal injected by the conversion crystal oscillator into the first mixer gets much lower on the higher frequency bands, but I do not suspect a bad crystal as the problem is the same for the 15-meter band and the four 10-meter segments.

Could it be just a design problem?

I wonder whether someone had a similar experience with that receiver.

http://cloughbrengle.homestead.com/

I've made some updates to the Clough-Brengle web page.
There's a new addition to the collection and I added two
photos of Clough-Brengle factories, one inside view
and one outside view.

I've got another new piece to finish cleaning up and then
I take some shots of it, and there are 2 more that should
be here in tomorrow's mail which will bring the collection
to 15 pieces of Clough-Brengle equipment.
There's also a C-B O-scope coming soon.

Thanks to Lou deGonzague I also have a new 1940 C-B
full line catalog that's by far the best of the nearly a dozen
I already had.

Check it out if you're interested.

2809. Re: Yaesu FT-101e has CW sidetone on AM transmit

Newsgroup: rec.radio.amateur.boatanchors
Date: 2005-06-27 19:15:46 UTC
From: whfkshfkshf@msn.com
Message-ID: <42c04f55.22511690@127.0.0.1>
Source record: 17398

I fixed it! A previous owner made a wiring mistake when he/she
installed the 6 kHz AM filter. There are two yellow wires that
connect to the mode wafer switch. One of them is for the AM filter.
The other yellow wire turns the CW side tone oscillator on when the
rig is in CW mode. A previous owner wired both yellow wires to the AM
tab on the mode switch. All is well now, and it works as it should.

Thnx.

2811. Re: Yaesu FT-101e has CW sidetone on AM transmit

Newsgroup: rec.radio.amateur.boatanchors
Date: 2005-06-27 19:20:01 UTC
From: whfkshfkshf@msn.com
Message-ID: <42c05125.22976238@127.0.0.1>
Source record: 17400

I fixed it! A previous owner made a wiring mistake when he/she
installed the 6 kHz AM filter. There are two yellow wires that
connect to the mode wafer switch. One of them is for the AM filter.
The other yellow wire turns the CW side tone oscillator on when the
rig is in CW mode. A previous owner wired both yellow wires to the AM
tab on the mode switch. All is well now, and it works as it should.

Thnx.

Yes, with "Winlink over Pactor III" being a very noticeable offender here, in that it happens to be so popular at the moment.

> It seems as if it would be very difficult to make these
> automated stations be friendly to other users.

SCAMP intends to address this, and it is a very important problem to be "fixed." There are many people who dislike the idea of using any amateur radio bands for linking Internet data/e-mail/etc. at all (my hypothesis is that they must not have been all that thrilled with packetmail either, but the Internet is the straw that's breaking their backs), but of those who aren't 100% opposed to the idea to begin with, Winlink not presently using busy detectors is a legitimate complaint.

> Both the pro and con in this argument are absolutely unwilling to listen
> to/believe the other side.

There's a lot of this going on, to be sure, but the fact that SCAMP is making slow and steady progress suggests that there are some level heads that will (hopefully) prevail.

>>Anthony, WB8MLA

Hi Purr Plexed,
Good Show OM!! Hopefully, you got a good deal
on it off of Ebay because of the problem, and now you have a very nice
radio.. You may want to now do a "brush up" alignment on the radio,
which only consists of the ceramic trimmers on the bottom, to bring up
the receive/xmit RF up due to component aginging over the years.. This
procedure is explained adaquately in the owners manual. Just take your
time, like you did with finding the AM mod problem, and you will have
one nice radio albiet being made in the very early 70s... I have had
four or five of these radios in the past, and they work really nice,
considering the age... Again, be patient, and one day soon you will
be able to download the Service Manual from mods.dk .. I have given
my .PDF to my friend for upload, but, since Yaesu is still breathing,
I think he will do it annonomously.... Anyway, congrats again! BTW,
There also is a mod to replace the sweep tubes with 6146s.. If its not
on mod.dk I will also scan this to a .PDF file.. and have my friend
up it also.. The darn sweep tubes are nearly gone, and at the current
market asking price, the conversion to 6146s while a little hard, is
worth it.. Best 73 to you then! Anthony, WB8MLA near Cleveland, OH
USA

I have a nice antenna tower for the taking/down. It is very similar to a Rohn 25. I think that it is stronger and is built very much the same. It has a Hazer mounted on it that was made for the Rohn 25. It is currently in Amarillo, Texas. It also has a nice house bracket and a ten foot mast as well as a home brew Jenpole. It has 3 guy wires, although they are not needed. I want the Hazer, but the rest is free to someone who will take it down. Contact me via my e-mail or phone 325-677-3675 to make arrangements to take it down. Thanks, Charlie Hugg, K5MBX

> I can't get connected to Mouser electronics

Once last week (I think Monday the 20th) I had difficulty connecting in the evening over the internet. Rather than call the order in over the phone (a pain with 60 different parts in qty 1-3!), I waited till the next day and it worked fine.

It seems to me that it's just network connectivity issues.

Tim.

But Dan THAT would make too much SENSE! (grin)

The trouble is that the unattended robot train has already left the
station.
ARRL deliberately did this without carefully coinsidering the monster
that they created and now that they persuaded the FCC to go along
with it, the problem is too late to remedy.

One can only hope that they will learn from this horrendous blunder.
Looking at the latest proposal from this same committee, (segmenting
by bandwidth only) I see only more stupidity being foisted on a
majority by a small group in a smoke-filled room.

Most of us are finding out what they did each time, only after the
damage is done.

WHERE is even the basic polling of radio amateurs?
Did they ask amateurs in other countries that will be affected
by this?

Do 40m CW ops REALLY want to be HEMMED IN to the bottom 35 khZ?
OK the rules don't SAY that will happen, but if you give the
Mexican and VE SSB pests and the digital ops and MORE rope than
they have already taken, 40m CW could become a thing of the
past.

YMMV

Hi Folks,

Recently acquired a BC-610F..The coils are in sorry shape, and am in need of
these specific units:

C-388-C (3-5 - 4.5 MHz)
C-390-C (5.7 - 8.0 Mhz)
C-449-B (14.0 - 18 Mhz)

Love to get the beast up and running..any help would be great!
Thanks 73,
Jeff W2NBC

I assumed you contacted your ARRL division director to make your views known? That's the mechanism by which decisions they make get input from everyday amateurs, so those amateurs' views can be represented in the "smoke-filled room".

After the ARRL's decision, how did your director explain to you how and why the decisions were made?

Or do you just sit and grouse and not bother to make your views known to someone who can actually do something about it?

P.S. If you identify yourself to your ARRL director only as "The Old Man", he's probably not going to pay much attention to you. And rightly so.

Roy Lewallen, W7EL

From my perspective, I can copy CW very well with a narrow filter, even
with a large amount of QRM from a digital system.

And, the digital system is probably not going to be able to deal with
my interference half as well as I can deal with its.

Since I am reading this on rec.radio.amateur.boatanchors, where it is
crossposted, may I recommend the use of the audio filter on the Collins
R-390A? It is frighteningly effective at getting rid of this trash.

Good answer, Roy. But I'm pretty sure that "The Old Man" isn't a League
member, or if he is, he takes no part in his Section. He said:

>> Most of us are finding out what they did each time, only after the damage
>> is done.

Certainly I heard about it well before hand, and expressed some concern, in
this case to our vice-director who happened to be dealing with this
particular issue. I got some additional feedback which reduced, but did not
eliminate, my concerns.

I suspect if "The Old Man" was on the radar of his section or division folks
as someone who was reasonably active, he would have had plenty of
opportunity for input early on. Most directors send out emails about stuff
like this to anyone in their division they suspect is active. Actually, if
I recall there was even a mention of this happening in QST well ahead of
time, but there is a lot of stuff in QST and something like this is easy to
miss.

Most folks, though, would rather bitch than take a few minutes to educate
their representatives. Kind of a shame, really, that so many folks can
spend so much energy bitching, but are unwilling to spend even a little
energy to make amateur radio better.

..

A frequency-hopping spread spectrum system with a reasonable amount of error correction won't be bothered much at all by iCW, as a matter of fact. :-)

Yes, but a frequency hopping system should recognize that this individual
channel is currently not good, and stop using it!

If it can, certainly... but it's the standard "near-far" problem in that you
may be able to hear the interferer (the FHSS system) but he can't hear you.

Hi,

My PR155 has 50 Hz phase modulation sidebands on the interpolating VFO, when operating from AC mains. It's clean running from external DC, but the sidebands return if the mains transformer primary is energised with the secondary open-circuited. Could it be the magnetic field? Has anyone else noticed this?

Bad supply caps leaving residual 50 Hz on the VFO supply lines. Get out a
meter and I bet you'll see AC noise there.

Clarification:
There is no ripple on the supply when the set is powered from DC, but I still get sidebands if I apply AC mains to the transformer primary with the secondary temporarily disconnected.

2857. WANTED Kenwood filter YK-88A (AM 6KHz) for TS-430S

Newsgroup: rec.radio.amateur.boatanchors
Date: 2005-07-04 00:20:28 UTC
From: Opcom <eccm@swbell.net>
Message-ID: <gh%xe.505$vT3.0@newssvr30.news.prodigy.com>
Source record: 17346
Cross-posted to: rec.radio.amateur.equipment,rec.radio.amateur.boatanchors,rec.radio.amateur.swap,rec.radio.amateur.misc

Looking for one..

Kenwood TS-430S optional filter YK-88A (AM 6KHz bandwidth)

Need for shut-in listening to SW broadcasts and the occasional AM
ham transmission.

The standard Kenwood AM filter is really the SSB filter which is
too narrow for AM BC SWL.

I realize this is an old part (1986), but maybe there is one out
there in a '430 that is only used for listening to SSB or CW (AM
TX does not require this filter, it's only used for wideband RX),
or maybe a junker TS-430S available I can rob one from.

Filter is plainly labeled and can be seen by removing the top of
the radio. May be marked "Trio" or "Kenwood" and will be marked
"AM FILTER YK-88A".

center frequency = 8831.5 KHz
passband = 6KHz @ -6dB
attenuation bandwidth = 11KHz >60dB

Thank you, any help would be appreciated, Please decode my e-mail
address below by removing spaces and subtituting @ for AT and .
for DOT (sorry spam is a real issue.)

Ed, Although I can still move many of my vintage BA's via "personal mobility", I have a flat-top work cart that's a bit more than desk height. I transfer to the cart, then to the bench. Beats the heck out of trying to horse an R-390A around. Similar carts are available from Harbor Freight. Look for one without the raised sides, though.. that's the key.

I inherited a number of old radio books. They are from 1917 to around
1960. They are so interesting I decided to send out some scans of some
pages out to friends. I thought if anyone wants to be put on my list I
could email out to them as well.
Just send an email to m005kennedy@netzero.net and include "radio scans"
in the subject line. A recent one that went out was a diagram of a 1917
spark gap transmitter.

WHOA! That sounds like magnetic leakage, yeah.

Another possibility might be AC leakage to chassis through a filter
in front of the power transformer.

Even in my younger days, since most of my radios weigh as much as I do -
(since I'm around 100 pounds myself) this has always been an issue.
While he's often a PITA; that's one of the main reasons I keep Randy
around: he's still useful as "gorilla" - ah - er "crane"! ;>).

Seriously - a sturdy cart about the right height to "slide" 390s, AR88s,
RAO-6's, ART13s and such to and from tables, the work bench, etc. is a
must. Equally seriously - recruiting help when moving the big ones goes
from being a convenience - to a necessity.

Best of luck with this project.
http://www.rigpix.com/linears/kwelectronics_kw1000.htm
Not only a schematic -- but a few pictures inside the unit (top and bottom)
in very good condition is also helpful for restoration purposes (especially
wiring harnesses).

Unless you specifically want a Kenwood part for restoration originality,
etc.
There is always International Radio (INRAD)
http://www.qth.com/inrad/

International Radio is a supplier of custom designed, high performance
quartz crystal filters for communications receivers and transceivers.
Filters are available for communications receivers and transceivers. This
includes ICOM, Yaesu, Kenwood, Drake, Heath, as well as special designs for
experimental work.

These guys do nice work. I will suggest getting an 8 KC filter instead of
the 6 KC one, though. Noisier, but better-sounding.

>> Thanks,
>> Ed

It also helps to use a "slide-sheet", like the nurses do in a hospital. I use an old anti-static mat; it's nice to have on my bench when I venture out of the BA realm. But it's also thick, big and tough enough to let me slide a BA on it from a cart to my bench. And if you don't care about the anti-static ability, then just use a piece on outdoor carpet or a heavy piece of linoleum. Once the BA is one the mat on my bench, it's also a lot easier to rotate too.

At work where I often encounter modern BA's (so what if a three-foot rack is full of solid-state and microwave plumbing, it's still BA heavy!), we use cheap Harbor Freight hydraulic engine hoists and a few scissors-jack wheeled platforms. Pick up the rack off of a shipping pallet, drop it onto a scissors-jack cart, pump it to a convenient working height, spin it around so you can sit in one place and work on it, and, if it needs to go to a specific bench work station, roll it there and transfer it with the engine hoist. (I suppose I should point out that modern military rack design calls for integrated lift points for hooks and cables.)

With a similar inspiration, you can work with the biggest BA's in your garage. (Appliance dolly wheels are good if the rack is moderately tall, maybe too tall to put on a cart.) And if you are seriously into BA's, then your shack has roll-in access, right? And you also should own a pickup truck, or at minimum, have your car equipped with a decent hitch so you can rent one of those open "garden" trailers so you can fetch the real prize BA's.

One of the things I regret not rescueing from the dumpster at work was
a "Genie" trolley that was used when removing/replacing heavy parts in
the mainframe computer. Think of a porter's trolley/sacktruck fitted
with long stabilising feet (low enough to go *under* a 19" rack) with
ball casters on the ends, and a moveable platform that can be raised
and lowered by a handcranked winch. Add to that various gripping and
clamping fixtures that could be bolted to the platform to hold stuff
and a maximum loading of about 300 pounds. The winch cable had come
off at one end and they scrapped it. 8-(>

The only drawback is that it needs a solid (and flat) floor to work on,
which is not nice for *you* to work on.

If I ever see another, I shall grab it!

Chris. (Next project: 96 pounds of Reception Set R107 - some knobs
missing and a certain amount of rust, but it looks otherwise OK.)

This sounds like a it could be a classic case of "tunable hum."

Does adding a good ground to the chassis
eliminate the hum, or lessen it? Are the mains lines
bypassed to the chassis in the radio?

It is not unusual for the mains to become part of the antenna
counterpoise, which under some circumstances can impose
a AC line frequency modulation on the received carrier.

95uH is awful low for 455KHz.

Have you the patience to rewind it yourself?

Just turn the top tray upside down, or make a plywood cap that drops
over the tray.
That way you can use the same cart for different jobs. I cut 1/2"
plywood and drop it into the bottom of the tray and add a thin piece of
industrial carpet to protect the finish on things that spend a lot of
time on the bottom tray.

I have a 4kHz one in my R5000 (compatible with the TS-430). I prefer that to
the Kenwood high qaulity 6kHz one.

My 430 has the filter so I can't test it, but if you look on the mods pages
you find a way of twisting knobs to get it to work without a filter.

You could also try the ts-430 yahoo group.

Geoff.

Hi,

I'm replying through the groups since someone might have information relevant to my filter and your needs.

I have a Kenwood YK-88A-1 which I used to used in my R-5000.

All of the filters in my R-5000 and TS-430 were interchangeable, except that the YK-88A-1 came on a small plug in PCB designed specifically to fit the R-5000 AM filter mounting.

I removed the PCB to use one of the SSB filters in my TS-450 which uses all plug in filters; which have the same designation as those in the TS-430 except for the "-1" which signifies the plug in PCB.

When I still had my TS-430 I compared the specs and found the only difference was the center frequencies of the CW filters.

I'm going into this explanation since the YK-88A-1 spec sheet shows a center frequency of 8830 kHz and as I recall from the TS-430 manual the only filter that differed was the CW one.

So - my conclusion, based on comparing AM, CW and SSB filters is that the YK-88A-1 should be identical to the YK-88A except for the plug in PCB, which I have removed. - it also has a part number of L71-0237-.5 and "8H3" stamped on the side.

If you are interested I'll be pleased to send you photos to help in your decision.

Comments and clarifications are invited.

Regards,
Dave

The mains lines are bypassed to the chassis - right behind the power inlet socket. I probed around this area, after seeing Scott's second post, but all seemed to be in order.

> It is not unusual for the mains to become part of the antenna
> counterpoise, which under some circumstances can impose

The phase modulation is on the local oscillator - never mind received carriers.

Thanks,
Andrew.

Hi Gang:

I found this in the basement and don't need it because I don't have this piece of equipment. I can't even recall how I came to have it. If you have one of these freq meters (with the cool film strip readout) missing the cover here's your chance to pick it up. It is in very clean condition; paintwork is excellent with a couple of die-size abrasions on the front. Rubber sealing gasket is excellent. The AC line cord is also there but the plug is missing. I'm asking $15.00 plus postage for it; any takers? Please reply by e-mail.

Tnx es 73,

Michael, W1RC

Arnal;
Found this on the QRZ web site.

You can send your name/callsign all the way to Pluto free of charge.

The New Horizons mission is due to launch January 11th 2006 to perform reconnaissance of Pluto-Charon and the Kuiper Belt.

All the names entered on the website below will be recorded on a CD which will be mounted on the spacecraft before it begins it's historic journey to Pluto and beyond.

Dial Up:
http://pluto.jhuapl.edu/ecard/sendName_ecard_content_low.html

Broadband:
http://pluto.jhuapl.edu/ecard/sendName_ecard_content.html

To get your call sign included just enter it after your last name, eg

John Doe/M0JAD

When you've entered your name there is a very nice certificate available for you to print out.

New Horizons Home Page: http://pluto.jhuapl.edu/

Hey Bob, not to bust your chops or anything but you've been trying
to sell this 75S-1 and 32S-1 combination for weeks on eBay and you
had offers of:

$869 from wb6vhk (June 13-23 auction)

$752.99 from mailordergun (June 23-June 30 auction)

$799 from gottahaveit1995/radiomart (July 1-July 4)

You're not going to do better here in boatanchors. This is a cheap
crowd.

I wouldn't mind owning that pair myself but that price seems high
considering that the 75S-1 has been "modded" and that Art Collins
didn't like serializing his products.

I understand that the early S-lines were serialized in sequence but
I also know that they were built in batches, very likely any sub-400
serial number S-line was built before or after any other.

I own 75S-1 serial number 55, got it from Dave (recommended seller,
along a couple others I've delt with here). Dave and I did the deal
below $300 on eBay.

I also adopted 75S-1 serial number 85 from Jeep, so I kinda have a
mini-collection of these low serial number radios. I consider
early S-lines an investment but only if the price is right.

As I said, given how small batch manufacturing works and Art Collins
known dislike for sequential serial numbers, my #55 or #85 could

have come off the line before your #2. They were obviously part of the very first run.

The difference is, mine doesn't have the Waters Q-multiplier, which has value to someone who uses the radio, but diminishes the value to a "collector".

If you want to sell the radio, you got a good offer from wb6vhk although, I wouldn't mind seeing how Marty/Radiomart hypes the serial number story.

Again, not to bust your chops, just my comments.

Hi:

Well, its not a happy situation.....I'm trying to help a divorced lady meet the court's decree that all of her ex's equipment must be sold. So I've been trying to sell her gear for her (at no charge). And that just means I'm trying to do what I can to get her the best price....And that includes the 75S2 and 32S2 that I have up on ebay also.

These are legimately rare according to Rob Blocksome, so I'm trying for $1800 on those..but will take $1500....

Yes, I've been trying a few times with those rigs.

Privately we have sold a 32S3A, 75S3C, 30K-1, KW-1, A4/KWS-1, SC-101, and a 62S-1 for her.

So, I appreciate your comments, and I do understand...

Thanks,

73, Bob

Hi Art,

FWIW I don't think the spkr is orig & it wouldn't be a good idea to try connecting it to the radio. The radio outputs hi-z & the orig spkr has an xfmr to deal with it (to the v/c z). It looks like the Quam in the pic has a bracket that once many have held an xfmr, but the style of the orig cab is very similar to the HRO-5 series & not what's depicted.

It'd be a good idea to show the front (panel) of the doghouse supply & a readable pic of its tag, too. The FB-7's supply was commonly shipped with the 2.5v early sets.

That spkr had a transformer a one time. Look at the bracket.

Hello Art,
This is only our second annual hamfest. Last year it was held in August, a day after the hurricane came thru. Our turnout was only about 300. Feedback so far this year says we should have between 500-750. Good odds for winning a door prize or the main drawing.
Worst case, we're only 6 miles from the 9/11 Flight 93 Crash Site / Memorial. That in itself would make the trip worth it. The Somerset

Somerfest is also running from Friday thru Sunday. Food, Music, Fun... I should work for the Chamber of Commerce...HiHi

Hope to see you here.

2916. New program. Two SWR meters

Newsgroup: rec.radio.amateur.boatanchors
Date: 2005-07-06 23:19:38 UTC
From: Reg Edwards <g4fgq.regp@ZZZbtinternet.com>
Message-ID: <dahoua$u2$1@nwrdmz01.dmz.ncs.ea.ibs-infra.bt.com>
Source record: 17255

This program models the behaviour of a transmission line plus antenna.
The line impedance can have any Zo. The antenna feedpoint impedance
can be any value of R+jX. Line length can be any fraction and number
of wavelengths. Line overall attenuation can be any value of dBs.

There is an SWR meter located at each end of the line. The meters also
indicate the reflection coefficients at the locations. Meter Zo can
be set equal to line Zo or to the standard 50 ohms.

Line input impedance can be observed to change versus line length in
wave-lengths, line attenuation and antenna impedance. The transforming
action of the line can be demonstrated. The smaller SWR and reflection
coefficient at the transmitter end of the line can be seen. The exact
increase in loss due to standing waves on the line is calculated.

The program can be used in practical applications and also for
educational purposes. It is hoped it may prevent the outbreaks in
violence which frequently occur in newsgroups about the meanings of
SWR and the notions of reflected power.

Download program SWRARGUE from website below in a few seconds. File
size = 41 Kbytes. Run immediately. No unzipping inconvenience.

I've seen the name Blocksome but gotta disagree with the conclusion.
I don't think the S-2's are especially valuable.

Back to the serial number 2 units....

Given that the auctions on the Serial Number 2 units has come in at
about $400 each, that's the price. Both for $800 roughly.

My own feeling is that a serial number 2 set is probably "valuable"
but unless I'm willing to put down my own money, my feelings don't
count. It's only worth what the market says it's worth, not a penny
more.

And for a lot of reasons, I would/could not bid even half what
you've received.

>
> Yes, I've been trying a few times with those rigs.
>
> Privately we have sold a 32S3A, 75S3C, 30K-1, KW-1, A4/KWS-1, SC-101, and a
> 62S-1 for her.

Well, those are primo units, 32S3A's are going for a fortune but
I've been watching the radio collectable market and prices seem
"soft" to me. The Collins group has a couple KWS-1's for sale.

I think it's because of several factors:

1. Radios have not crossed over into the general Yup-boomer,
nut-case, metro-sexual, "collectable", PBS-Antique-Roadshow market,
where a wooden chicken is worth tens of thousands of dollars.

If that ever happens, watch out! A 75S-1 would be worth fifty grand. That's any 75S-1.

Well, Catalin radios have crossed over but not S-Lines.

2. Hams are "cheap" and think of radios as appliances. "It doesn't work as well as an IC-720 or TS-520 and I can get that for $150."

Well, yeah. But that's not the point of a boatanchor.

3. There are relatively lots of S-lines and similar radios. These look expensive so even the clueless didn't toss them out. Except for the reports of S-Lines and KWM-2's crushed or abandoned at the end of the Vietnam war, most of the radios have survived. So many that a 1958 75S-1 is worth "about" $250, maybe $300.

This is just me but I'm expecting a *real* boom in the value of Collins. How much? How high is the sky?

I know folk who collect military stuff, civil war, WWI, medals, guns, reproductions even.

I wonder why Collins and other Vietnam and cold war era radio's don't appear in military collections. Curtis LeMay, SAC, Listening Posts, Signal Intercept, the woodpecker, all that cold war era stuff was interwoven with Collins and MARS, and the dawn of SSB.

Instead we have the Antique Roadshow on PBS and silly yups bidding up the price of wooden chickens.

Good luck to you and that lady. Seems strange that she got the radios in the divorce, probably a sad story there.

>
> The tag is on top and not on the side.

Hi Art,

Not to drag the matter out, but yes, while the tag is on top, the '30's National doghouse-style supplies have a sloped panel on one upper side where the plug for the rcvr pwr cord, pilot light & switch are. Although National WAS known to have done unusual things once in awhile, according to what parts they had on hand. It is definitely a National supply cab, and original plug & cord, & no reasonable doubt that it came with the radio tho the tag info will be informative.

And not in any way trying to criticize your listing as is so common, just wishing to be helpful. :-)

FWIW, you also have a mixed coils set. So does my very early HRO (1st 3 mos of production). Many collectors have a lot to say about this, and there is still some confusion about when white or black scapes were shipped (and the AWA "authoritative" articles have a number of errors, too!); but it was also not uncommon for some buyers to get it with only one or so coils, then buy others as they had the money in the mid-'30's, or even to trade some coils off with others. Any coils that were originally aligned & shipped with the rcvr will have its s/n stamped on them. Those that weren't are easily aligned & it's in the manual.

The earliest HRO's (incl Jr's) will have large white ceramic resistors under the chassis, the round tube shields like yours has, and the 2.5v tubes - among other small things.

There are a number of prevalent myths about very early Nationals, and it is wise not to rely too much on what is found on the 'net. My own set was correctly identified by Wayne Childress, who was just getting out of the hobby, and whose National literature collection alone went for 5 figures. I learned from Wayne that National was all over the place as far as consistency of parts went in the early years, and that many "authoritative" edicts are inaccurate when inflexibly applied. National was a parts hoarder that used whatever they had gotten a good deal on from one small production run to another. I had many collectors telling me that my set was not as early as it is because it

doesn't have the "white meter button." They are wrong. Wayne also sold me a correctly restored 1935 spkr cab (it was the last of the stuff he was getting rid of), which is very similar (but different) to that sold for the later HRO-5 series. But this doesn't by itself rule out National shipping that cab with the Junior, and it's brown inside lining is exactly like what National used. It also may be that someone installed an OPT under the rcvr chassis, which was not uncommon, so they cld use the spkr with other rcvrs as well and/or not have to have higher voltages going thru the spkr leads. So do not take my input as absolutely reliable, but only another guideline.

HTH,
Frank
(not a National expert, but a digger of truth)

Source record: 17267

Rich, I paint cabinets all the time..You can go to Home Depot paint section,pick up a PREVAL spray kit .go to auto paint supply store (I use PPG dealer) take your cabinet ,they will scan it and come up with exact formula to duplicate it.A 1/2 pint is probably minimum order.also you will need a reducer to thin the paint and get a smooth finish .Paint store will advise you on this..So your first job will cost you maybe $30.00 after that, a cabinet job will cost about $10.00 a job.. If you only need to do one, it is still worth $30 .. I have done several NC 300 rec`s ,they look good..

Carl

I got away with on a lot of early car radios, but the question is more
related to the amount of "iron" in the transformer core. Some
transformers have enough engineered leeway to allow operating
at lower frequencies, others will quickly overheat. Try it and see,
watch the transformer temperature closely..

Pete

I ran an old RCA Carfone that way back in 1972. Scrounged up some
big filament transformers (and put them in series for 12vac), and
connected them to the Carfone's power supply where the vibrators
fed their transformers. I recall the Carfone's transformer did
get fairly hot, but I never had any problem doing it.

Maybe, but it depends. Some of those transformers were very underdesigned,
and have too low an impedance at 60 Hz to work without overheating. If you
have a bridge, measure the impedance of the primary with the secondary
disconnected. If it's substantially higher at 100 Hz than at 60 Hz, don't
try it.

Haven't seen much on this radio lately. Is there still interest in this boatanchor? All I get on Google is some sort of converter for use with the radio, plus a boxcar load of model cars.

You might get a LOT more hits using R-390 or R-390A instead. That little
- makes a lot of difference on search engines.

And there's a _very_ active -- and mostly on-topic -- R-390 mailing list
through qth.net. Point your browser at <http://www.qth.net> to see all
the mailing lists hosted there.

Source record: 17299

Hi

A very experienced UK radio engineer, collector and restorer, Chris Parry, has written a 91 page e-book on the above topic and asked me to make it available on the internet. He is happy for it to be freely distributed in the interests of making valve radios in full working order available for the future.

See the link on my collectable radios web site at http://www.vk2bv.org/radio/index.htm for full details of Chris's contact information and downloading.

I think anyone who restores valve radios will learn something from it. If you find it useful, I am sure Chris would appreciate an email note of thanks.

The common cures:

1. Make sure all the parts are turning smoothly.
2. If it uses a tension spring make sure the cord is adjusted correctly
to where the spring serves its purpose in maintaining the correct tension.
3. If its the type of drive where the cord does several laps around a
small shaft, make sure that its clean and not gummed up.
4. Cord could be worn out, glazed over so-to-speak.
5. Apply some rosin (music store) or even smear some contact cement
(lightly of course) to the string as a temporary fix.

There are already solid state replacements on the market for old car
radios. If you are lucky, one of them may work. Ask Gary Tayman on
news:rec.antiques.radio+phono for information about them. He restores
old car radios for car collectors.

If there ever was a candidate for a tube-redesign,
here it is. Sure you could bid big bucks for the
few remaining examples of a
tube-that-never-went-anywhere (the 8122) or pick
an approximate replacement from the several
inexpensive Russian tx tubes and do a bit of
tweaking. Help with such rf-amp efforts is amply
supplied by searching on 'Rich Measures' et aliis.

The all too common focus on Form Instead Of Function.
What the pain must be to view that web site over dial-up...
This is telling:
" 00898 hits since June 7, 2005 "
(Most of which are probably NG readers checking on your complaint. :-)

My non-commercial web site gets more hits than that PER DAY.

I run several different web browsers on my linux box here for those
occasions when I MUST get in to see a web site. Usually, tho', I
don't waste my time -- I just click off somewhere else...

The most infuriating are the home pages consisting of NOTHING but
flash eye-candy. (The plus there is that type of web site rarely
gets into the Google lists.....)

I ran into an electronics wholesale website that was built entirely in flash I had updated the crappy Macromedia Flash software less than a week before, and it was out of date already so I e-mailed the webmaster and told them I wouldn't install more software on an already full hard drive to buy parts that were available from people who really wanted to sell, not just advertise. I wonder if they fixed the site, or went out of business? I know a lot of people who won't wait 10 minutes per page to download to be able to look for parts.

You emailed the wrong fella. The webmaster's Prime Directive is to protect
and expand the webmaster's job. You need to get the message to the folks who
lay awake at night -- wondering how (if) they can stay in business.

More than installing "...more software on an already full hard drive...",
I'm tired of spend a large percentage of my "computing time" constantly
updating my system(s). Imagine, if you will, devoting that kind of effort
on your car, your TV, or your HVAC -- just to get the same 'utility' out
of it tomorrow that you got out of it yesterday. sigh...

The webmaster was the only address I could find without installing
the software and all of the blind e-mails to info@, sales@ and other
common business addresses all bounced. it doesn't really matter, because
I can't remember the name of the company, even though their flashy
trashy website is supposed to make you want to come back again and
again.

Dear Friends,

This weekend, I picked up an RAK-7 VLF receiver. It seems to be in decent shape but someone has robbed the meters out of it. Does anyone have a junker chassis they would be willing to part out? if not, can someone recommend substitute meters?

Also, if anyone has a manual, I'd be interested in that too!

Thanks everyone!

So do I, however I make a paste mixture of the rosin and a small
amount of nail polish remover. Applying the paste to the dial cord
usually solves the problem.

Certainly. The 100hz was a squarewave & there'll be enough core for
your 60hz sinepower. It's the radio units running 400hz & such that
are problematic & far too undersized. But if I were you I'd scope it
with the vibe under load first to be sure its really a 100hz (or so)
supply - I don't recall seeing a 100hz vibrator though there are a lot
of other things I haven't seen, too. You'll also have some filter L/C
issues to think of, or at least check, and there are hash components
you can get rid of. If the buffer cap's good I'd leave it in for handy
transient protection.

Hmmm...I'm not so sure about this. I agree with Frank's concept but the
power xfmrs I see in car radios with typical ~100-120 cps vibrators seem
awfully small for 60 Hz use. Never tried one, though. Don't think I would.

Thanks for the further information. However, here is my problem: first, for me its a long drive one way (5-6 hours and I'd have to stay in a motel Sat night, come back home Sunday, PM). Then, I was driving around yesterday and the bigger problem: sticker shock at the gas pump (I was gazing at a sign that showed $2.30+/gal for low test regular) . I'd be spending more money on gas for the round trip than I'd expect to spend on goodies, toys, parts, etc at the fest itself. :-(

Gene

In Chris Parry's case he is a qualified design engineer and used to be professionally involved with these radios. His restoration work is merely a hobby these days as he now works in a diifferent, and more modern, electronics field.

This professionalism shows in the details, especially design faults, given in the book. Read it!

I run a non-Windows OS at home, and can't run Flash -- nor would I if I could. I don't want eye-candy websites on my browser. I do want to be able to see things with a minimal browse, such as Lynx, or with a GUI browser such as Mozilla Firefox. I never, never, never use IE: IE is a way to let bad guys subvert your system to their own purposes.

Here's a precept to design websites by, from someone with expertise and experience both:

Any site should be designed so that it's usable as a
dead file tree with no server-side smarts. Any sort of
active pages or search engines should be an add-on, not
essential.

Take a look at: http://home.earthlink.net/~mike.terrell/ if you have
a few minutes.

It is all written with Wordpad and uses a CSS to keep the design
uniform, along with a split Javascript to hide the E-mail address. I
use this simple format on all the pages I create. It is tested to work
with several older and current browsers, even though faults are found
when its run though one of the HTML verification sites. When I correct
the "Errors" it doesn't work with some browsers, so it will stay the way
it is, as long as most browsers will work with it.

You can still access the sites without CSS or Javascript enabled, but
you do lose some formatting and it takes longer to navigate the site.

Here is a site that has some very complex elements - such that require a reasonably up to date browser (I.E. 5.x Netscape 7.x or such - and must have JavaScript) - yet loads very fast; and has several neat features that don't "weigh it down".

Michael, in FireFox (with Java), when I click on a link, then hit the 'back' button on my browser, the text on the home page is visible for only the link that I previously clicked. All the others are replaced by a straight line within their respective windows. Reloading the page has no effect. I have to click a link, then hit the 'home' link to reload the page in it's original form.

Is this a known issue?

Perhaps, but I recently picked up a brand new set of 8122's at a local
hamfest for $175. However, I always scout around for spares.
It's been my experience that if you are in no hurry to find
replacements, they eventually show up at the right price.

BTW, the 8122 is still in production by Burle, so it isn't a case of
the last few examples. There is currently someone selling a dozen used
ones on eBay for the package price of $500. Even if half are good,
that's not a bad price. Thus they are out there.

Why do you say that the 8122 never "went anywhere"?
They were in use on thousands of Merchant ship HF and military HF
installations. It was simply more of a commercial tube than a tube
sold to hams such as the 3-500Z, etc. That's probably why the tube is
still in production, over 40 years after it was designed.

I wonder about the future availablity of certain Russian tubes.
Many of the ones being sold date back to the military needs of the
USSR and are no longer in production.

Ask Ten-Tec who designed their Titan II amp around the Svetlana
4CX1600B and then found that they couldn't buy that tube in
quantity....

Well, thanks again.

FWIW, it sure would be nice if for some of these fests
someone could go around, at the end, with a video camera or d-cam and take
pictures (something like for that URL of the last one) of the unsold major
stuff (and maybe guys selling parts?) and post these on the club website
as a "possibly still available" item and an email address (or something
like that).

All a guy would need is: a cardstock with price and email address in felt
tip pen ink, held in front of the gear. That shouldn't be too hard, or the
guy selling the stuff could provide his own jpeg images on a floppy disk.

I'm not particularly interested in eBay/auctionering stuff
(since you have to play the escalating price game, then the shipping
question, etc). But, if a guy said "Here is X, I'd like Y dollars for it,
and subject to negotiations" I could get more interested in this.

I have heard guys using soap and water to "wash" the inside of badly
gooked up radios, while Im not that daring I was wondering if there is
something I can spray on and blow off with an air hose?
I feel reluctant about having water inside my radios.

Thanks...Gil

I have for sale a clean Kenwood TS-120S HF Transceiver in great working condition. It has been stored for 10 years. It has a few scuffs and scratches but is in overall good shape. It comes with the power cord, no mic, no manual, but they can be downloaded from the Kenwood Webpage. Price is $195 plus shipping from 79602. This is a great little mobile rig.
Thanks, Charlie Hugg, K5MBX

You know, years ago I was a heavy smoker. I NEVER achieved any
degree of buildup in my radios, most of which I still own. Some
Windex would remove whatever buildup occured on the outside
of the boxes at the time. I wonder what the hell these guys were
doing to achieve that level of contamination!

Gil, try a cloth dampened in Windex, that should help.

Peter...I am looking to clean the inside of a radio I just picked up at a hamfest. This thing looked like it was rolled around in tar. I managed to get the outside nice and clean with windex and simple green, amazing.... there was a real nice radio under all that crud!
Now, the inside I managed to blow some stuff away but there is still a muddy, gummy film that I would like to get off, everytime I fire this rig up with the heat of the tubes my basement stinks like an ash tray and I want to stay away from the soap and water wash if possible.

Thanks...Gil

What ever you do, DONT USE 409 or FANTASTAC, it will take off the paint! I have several items that were given to me by my best friend who smoked forever and they are yellow. I've got a metal radio desk he used and thank goodness I started on it first, because paint came off in places that couldn't be seen. I asked the Hallicrafters Group and they suggested several homemade cleaners and Simple Green. Simple Green works very well and doesn't remove paint. However, be careful of glass dials, even water can remove the paint there. Try to clean with a swab without touching the paint.

I have used rubbing alcohol and a soft toothbrush under a chassis a couple of times. I'm with you in not wanting to get things too wet, but the alcohol evaporates quickly and doesn't seem to harm anything.

I'm not sure if it will work, though, depending on what sort of goo you have. I think the worst radios come from a house where there was a lot of smoke plus a lot of greasy cooking and poor ventilation. Smoke alone couldn't create the greasy layers that I've seen on some radios. The last SX-28 that I did smelled very strongly of cigar or pipe smoke but was not greasy. Anyhow, I kept cleaning and cleaning as I was restoring it, and the smell eventually went away.

Regards,

Phil Nelson

Spray down the top of the chassis with Simple Green avoiding getting any in the IF/RF cans. Let sit for 30 minutes and lightly rinse the top of the chassis with water, again just alow the water to run across the chassis avoiding the top of any cans. Lightly blow air to dry. Alow to sit in a warm enviroment for a few days to dry properly.

I tested it with Foxfire 1.0.4 and it work like its supposed to if
you use the navigation on the web page, but does what you said with the
browser's back button.

I'll see what I can do about it, but I may have to settle for a note
to remind people to use the links on the web pages.

ya gotta keep things in scale - he has 431,687 POSITIVES. So his negatives to positives are about 3.4% of the total. There are a GREAT MANY Ebay sellers with a FAR WORSE ratio of bad to good. He actually has 15020 negatives.

Not that I'm defending him - just helping you understand basic math.

He is doing good at basic math. That seller is at 88% and should be
dumped based on the ratio.

Radio-Mart has some bad feedback, but is still in the high 90s. I've
dealth with him, and had no problems.

Back in the late 1950's, hybrid auto radios with 12 volt plate tubes for all except the audio output stages were built by Automatic Radio for Ford and Chrysler. The first production was in 1958. A Motorola power transistor was used in the audio output stage. A search through Sams Fotofacts for 1958 and later should give you some schematics to start with. A trip to an auto junkyard might give you a radio.

> rgds,

I seriously doubt that a buyers feedback rating has any effect on
eBay. Furthermore, this is as it should be. The feedback is there
such that each participant can make their own determination on whether
to deal with an individual or not.

Nothing to see here, move along....

If you're going to go JunkYardin' for a radio - might as well get a
goodun' - late 50's early 60's era Cad. The WonderBar mechanism is a
treat (and works VERY well) - and all of the tubes (including the relay
driver tube) are 12V tubes (audio out is a single transistor).

best regards...

Pearce Simpson, model Newport 120..... Schematics?
With broken heart, I've probably thrown away 10 or 12 of these when I quit my marine electronics business. Now that I want to return to real Ham radio, and have no transmitter, I'd like to convert this old rig into an 80 and 40 meter cw rig. (just the transmitter) Should not be too big of a project, but having a real schematic (or one that's fairly close) would make memories return like magic!
TIA, Old Chief Lynn, W7LTQ since 1948

Ebay's feedback reporting is almost meaningless. Take the example of
radio-mart.

In 2003 his alter-ego, gottahaveit1995, was bidding radio-mart's auctions
and even listed feedback (positive, of course) on radio-mart's feedback
pages. Radio-mart appeared suspended in Spring of 2004. Some three months
later, radio-mart reappeared as a registered user and started selling again.
The feedback from gottahaveit1995 on radio-mart's feedback page then
(conveniently) disappeared....yes, ebay erased it!

The bottom line here: if ebay "fixes" someone's feedback to coverup an
obvious fraud....how much credibility does ebay have, let alone their
much-faulted "feedback" system.

To me, the feedback system remains a joke.

Lynn

Weren't those around 2 mc for the old marine frequencies? It might be a lot
easier tuning one to 160 meters than trying to get it up to 40 meters.

Pete k1zjh

3037. Question regarding ICOM IC735 fan repair

Newsgroup: rec.radio.amateur.boatanchors
Date: 2005-07-14 00:30:24 UTC
From: Bernie Murphy <bernard.murphy@sympatico.ca>
Message-ID: <zmiBe.5165$6e3.526895@news20.bellglobal.com>
Source record: 17226

The fan in my trusty ICOM 735 has stopped working. This is the small squirrel cage fan that cools the PA heatsink when the radio is transmitting. Has anyone ever had a fan failure? The fan itself spins manually. I called ICOM Canada and they indicated that ICOM no longer stocks parts of this type for the 15 year old 735. The failure could also be caused by the control circuit in the ICOM 735 that turns on the fan at different speeds depending on the temperature of the PA heatsink.

If anyone has a parted out ICOM 735, please let me know. Highly unlikely --- as ICOM indicated that the ICOM 735 was an extremely reliable radio.

Any ideas here or experience with this problem? Is there a newsgroup devoted to ICOM radios?

Regards,
Bernie, VE3FWF, Ottawa, Canada

Yes, for sure! And some of these true boatanchors had MHz taps on the
coils (some call them inductors) switched with the channel selector switch.
I haven't had time (I'm retired, you see) to look inside yet. 160 meters has
so much local noise around here, in addition to needing more real estate for
antennas, that I'm thinking 40 is so much quieter, and half-wave antennas
will fit on my lot in any orientation.

Source record: 17229

Greetings Heriberto,

The SP-400X covered 540 kc to 30 mc, the SP-400SX covers 1.25 mc to 40 mc. Those were the only two versions of the SP400 series produced. The X in the designation indicates that it is equipped with the crystal filter. For an example see:
http://cgi.ebay.com/ws/eBayISAPI.dll?ViewItem&item=5753985850&category=4673

The SP-100 & 200versions were produced in many versions counting the military and civilian versions. The 100 series has telltale dual toggle switches between the bandwidth control & the Main Tuning control. See for an example:
http://www.testequipmentcanada.com/Radios/superpro.html

Refer to this website for a chart that breaksdown the SP100/200 versions:
http://www.webex.net/~skywaves/commrx/Hammarlumd/SP-10/Super-Pro_Data.html

If you obtain a schematic, I sure would like to get a file copy of it. I worked on lots of marine equipment in the mid 50s, but never a Pearce Simpson that I can recall. Worked mostly on Northern Radio and Apelco. In Ketchikan, AK, any boat owner who could afford it had a Northern, along with a Zenith Transoceanic and an S38C at home.

Your conversion to 40 & 80 should be quite simple.

Don

My first taste in marine radios was as a helper in 1948, getting purse seiners ready to head for Ketchkan. There was a lot of converted "war surplus"..... The only one that sticks in my mind was a BC-375 transmitter converted to crystal control. Remember that one? I had one still operating as MOPA, using a bunch of old junk car batteries for power. Boy, did it have a distinctive yooop did dee yoop! Good for a half hour CW on 40 meters before charging batteries for another day.

Second chance in marine radio was a 20 year stint beginning in 1977. Northern Marine 550's were king of the North Pacific (if a good man did his work with the tuner, antenna and ground system! Bet you had a good time with those too!

If I come up with the schematic, I'll pass it on Don.

Old Chief Lynn, W7LTQ

Have you ever seen the fan in a 735???

I have never seen one like that in a Mouser catalog.

3048. Speaking of the Icom 735

Newsgroup: rec.radio.amateur.boatanchors
Date: 2005-07-14 13:22:13 UTC
From: David Stinson <arc5@ix.netcom.com>
Message-ID: <9GtBe.3352$dU3.2948@newsread2.news.pas.earthlink.net>
Source record: 17237

The common tuning encoder problem, where you spin the VFO knob, but the frequency changes randomly are jumps around- Icom no longer sells the encoder assembly, which was their recommended "fix."
I've had the encoder apart and looked at the diagram, but haven't gone any further. Looks like if the resistors that feed the optos drift off value, it would hose up the encoder. Has anyone else addressed this problem at component level? Thanks, D.S.

I would bet a control circuit failure. Measure the voltage across the fan
and see if there's anything there. I bet there is not.

If the motor has failed, you will probably not see DC continuity across
it either.

While you have it open, put a drop of turbine oil on each of the motor
bearings so they stay good.

That marine transmitter was made to connect to a short antenn. So 160
meters would be easy.

COMPUTERS - ELECTRONICS - HAM RADIO - COMPUTERS - ELECTRONICS - HAM RADIO

FLEA all SUMMER at MIT
Sunday July 17th 2005
9AM-2PM

Come to the city for a great flea - plenty of free parking.

MIT's electronics and ham radio flea will take
place on the third Sunday of each month this summer,
April thru October.

There is tailgate space for over 600 sellers and
free, off-street parking for >2000 cars!

Buyers admission is $5 (you get $1 off if
you're lucky enough to have a copy of our ad)
and sellers spaces are $20 for the first and
$15 for each additional at the gate.

The flea will be held at the corner of Albany and
Main streets in Cambridge; right in the Kendall
Square area from 9AM to 2PM, with sellers set-up
time starting at 7AM.

SEASON PASS + Advance Seller Discount

A sellers discount season pass is available which
offers a 30% discount. By prepaying you get a
discount and earlier admission. See the registration form.

*** Attention Sellers ***
Prepaid vendors.. Season Pass or monthly,

will be admitted FIRST.
Separate lines will form prior to gate opening
for prepaid and nonprepaid vendors

!! RAIN or SHINE !! Have no fear of rain, a covered
well illuminated tailgate area is available for all
sellers (6'8" clearance).

Talk-in: 145.23- (PL 88.5) W1BOS/R and
W1XM/R-449.725/444.725 (PL 114.8/2A).

Message-ID: <n8adnZD3ArIxLETfRVn-vA@comcast.com>
Source record: 17170

Here's a neat gadget to help you get your wire antenna high in the trees.

According to the testimonials:

Mike, K2CSJ, said, "... Worked like a charm. ..."

Gary, W9VJ, said, "I received my EZ Hang at noon today and had my B&W folded dipole up where it should be that very afternoon. ... Thank you very much for a product that really works."

Tony Davis, KN4VL, wrote,"Great idea and great product, I'm a happy customer and will recommend others to your website."

Howard, W5OM, says, "... I put the wire over the topmost branch, exactly where I imagined it should go [85 feet high]. ... I know of no other way I could have managed this, and am perfectly delighted. Thanks for building these gadgets!"

It's an "EZ HANG" slingshot tool. The URL is
<http://www.ezhang.com> or
<http://www.ezhang.net/store/products_all.php>.

Yes, I know it costs a hundred bucks, and anyone can build it. So, there is no need for anyone to post 'flames.'

The bottom line is: 1) It's expensive. 2) Anyone can make it, but 3) It works and 4) if you're honest with yourself, it's a lot easier to buy it than to try and make one yourself.

Finally, I own one and it works. And, I am *not* a salesman for EZ HANG. I just think it's a great product.

73,
BA

Very nice unit. I know people who use them, and they work pretty well. Personally, I saved about $75.00 by buying an inexpensive slingshot, and also a "game tracker" from Cabella's catalog sales and ended up with a product that works even better.

3084. Fuse for TS-830 & Neutralization ?

Newsgroup: rec.radio.amateur.boatanchors
Date: 2005-07-17 11:35:00 UTC
From: Gary
Message-ID: <mtfkd19deutarv610hg5ergd9baetmerf4@4ax.com>
Source record: 17173

I bought a TS-830 from a ham friend that buys estates etc. He couldn't get more than 30 watts out of the '830. I tried it and by putting the drive control at a low level then dipping the plates and adjusting the load control and finally increasing the drive control I was able to get 100 watts out. Then the rig went dead. I checked the fuse on the back and it was blown. It was a 3 amp fuse but right underneath the fuse holder in white lettering it said 6A I'm wondering if the '830 should have a 6 amp fuse instead of the 3 amp fuse that was in there ?

Also I noticed that even when the plates were dipped correctly that the plate current meter at 100 W out was almost pinned to the max, maybe it needs neutralization ?

Thanks in advance.

Gary

Fuse value depends upon what line voltage the unit is set up for. The TS830S can be either the 110VAC or 220VAC....you know.. higher voltage lower amperage.

Neutralization need is not indicative of a power supply problem.. look at the rectifier unit assembly and check for a problem there.. ripple , hum, wrong primary winding wiring set up.

Source record: 17178

Hi,

I would think that you would use a 3 amp fuse if wired for 220V,
6A for 110V (I don't have a Kenwood manual to check this,
but a 6 amp fuse sounds right at 110V).

First check your resting plate current before tuning up.
With PTT set to transmit, and no drive/no audio,
the finals should draw about 40mA plate current.
If not, adjust the bias control for this reading.

The proper way to dip a pi net final is to start with the loading
capacitor fully meshed. Apply some drive and quickly dip the final
plate current using the plate tune control only.

Then apply full drive* (see note) and read the plate current
(it should be much less than the rated 250 mA).
Assuming it is less than the desired 250mA,
increase the loading control slightly
(say, enough to result in a 20 mA increase in plate current
with full drive)and then quickly redip
using the plate tuning control.
(+Always+ redip with the tuning control last,
or you will be operating with your final out of resonance).
Note that you are always dipping with full drive applied.

Note that you can dip the final using the plate tune control
while less than full drive is applied (easier on the tubes),
but you then must increase the drive to full drive to see
if you have reached 250mA plate current at dip
with full drive, which is your goal.

Continue this procedure until either the rf power output
no longer increases when you increase the load control
with drive,
or you have reached 250mA plate current at dip with full drive,
whichever comes first. Do not operate with more than
250mA plate current at dip, full drive, or you will overheat
your finals.

*Note: By "full drive", I mean enough drive for the plate current
to stop increasing very much with increasing drive (saturated),
not that the drive control is fully clockwise.

If you don't get around 100W rf out at 250mA dipped plate current,
one possibility is that the final tubes are not well balanced.
With the bias set for 40mA with both finals installed,

if you remove one, the resting current should be 20mA.
If the tubes aren't well balanced, one tube may be hogging
all the current, and the rig will be unable to deliver more than
about 50 or 60 Watts. Note: remove one of the tubes
completely for this check, do not just remove the plate connector
of the unused tube, or it may be damaged by excessive screen current
(the screen tries to act like the plate). Caution: high voltage
at plate caps of the 6146's - keep one hand in your pocket
when you poke around near the final cage. Use a shorting stick
before touching the plate cap.

To check neutralization, you transmit with no drive,
PTT on, no audio, (i.e., same set-up as 40 mA bias check),
and with the loading capacitor fully meshed, you rock
the plate tuning capacitor throughout its full range.
The plate current meter should remain at 40mA.
Any sudden, drastic increase as you vary the plate tune
capacitor with no drive in this manner indicates
a neutralization problem. Note: this can be a destructive
test, as the onset of a parasitic oscillation can be sudden,
with very high plate current. Be ready to turn off
the final quickly. A dummy load is best for this test,
rather than an antenna.

73,
Ed Knobloch

3090. Re: Fuse for TS-830 & Neutralization ?

Newsgroup: rec.radio.amateur.boatanchors
Date: 2005-07-17 16:03:34 UTC
From: Gary Schafer <gaschafer@comcast.net>
Message-ID: <ca0ld1lgctolli71hobtvgj8e47oh1p4qp@4ax.com>
Source record: 17179

A check for proper neutralization can be done with full drive and the final tuned properly. Watch the power output and the plate current as you change the final plate tuning capacitor. Minimum plate current should occur at exactly the point of maximum output. If it does not the neutralization is off.

If you can observe grid current, the grid current should peak at exactly plate current dip also.

You can rotate the neutralization cap slightly and try the above again. It will get worse with one direction of rotation of the plate tune with a particular direction of rotation of the neutralization cap. A little diddling and you will be able to determine which way to go.

3092. Resistor frequency response

Newsgroup: rec.radio.amateur.boatanchors
Date: 2005-07-17 17:18:14 UTC
From: Reg Edwards <g4fgq.regp@ZZZbtinternet.com>
Message-ID: <dbe3sm$f3f$1@nwrdmz03.dmz.ncs.ea.ibs-infra.bt.com>
Source record: 17181

FREQUENCY RESPONSE OF RESISTORS.

Program METALFLM.exe 41 Kbytes.

This program models small low-wattage wire-ended resistors including spiralled metal-film resistors. The model's equivalent circuit is a chain of T and L networks. Values of lumped inductance and stray capacitance are estimated by the program from the component's physical dimensions.

The component with it's terminating leads is treated as a lumped L and C non-uniform transmission line. The program computes input impedance from 10 KHz up to 5 GHz with the other end grounded. Fast and slow frequency sweeps are available to observe maxima and minima of Zin.

Max and min Zin are approximately related to the physical length of the component, including connecting leads, but occur at frequencies far higher than the usual and useful working frequency range.

The reflection cefficient and standing-wave-ratio are calculated with reference to Zo, Zo being the DC value of the resistor. The usefulness of the component as a dummy load or for other purposes at any frequency can then be ascertained.

The effectiveness versus frequency of solid carbon-rod resistors and multi-turn UHF chokes, which are of similar wire-end construction, can also be determined. Chokes can be wound over the bodies of high-value wire-ended resistors, the parallel resistance value perhaps having some desirable effect on the ultimate response.

Another use for resistors having a good high frequency response, or at least a known frequency response, is for ratio arms and switched resistors in impedance bridges and other measuring instruments.

Download METALFLM in a few seconds and run immediately.

The TS-830S used a 6 amp fuse for 115 volts.... I owned one once and it was one of the finest transceivers I ever had.

IIRC neutralization was only really a big issue on the high bands like 10 meters anyway.... where you should see about 80 watts output.

I never had a 6140B final tube fail.... only a weak 12BY7A driver.... try changing that one first if rated power is low.

Mike, W9WIS

Thanks for the posts folks. I had a good look at the schematic and I'll try various suggestions.
Looks like the fan will run from the 12 volt power rail with a 330 ohm resistor in series.
The IC-735 has discrete transistors. That should make troubleshooting much easier
than dealing with surface mount devices.

FS: I have about 5 or 6 legal size boxes of Marine radio service manuals. I got them from a friend who used to work at Radio Holland in Houston. They service shipboard radio equipment and when the ships dumped HF radios for satellite stuff he got a pile of their old manuals. No, I am not going to look for a specific manual in all that stuff but I am going to offer it all as one lot to whomever might need the stuff. Some of the names I saw in there (many more too) are Sailor, Motorola, Data Marine, SAIT, Marconi Marine, MacKay, Icom, Debeg, etc. If anyone is interested before I post it all on eBay, let me know. $125 takes all. Located in TX 77840.

> I have the same problems with 100 lbs. receivers, going in and out
> of a six foot rack!! The AR-88D is a 98 lb. beast!

Here's what I do. Good engineering practice calls for a minimum of 1 RU between rack mounted items. I have two 1 RU panels with fairly beefy angle stock mounted on them. Put one on the front of the rack, under the radio and attach the other to the rear rack rails. Cut some pieces wood long enough to firmly rest on the angles and thick enough to fit snugly against the bottom of the unit. Note- it has to fit against the bottom of the unit, not the bottom of the front panel. Pop the rack screws out of the unit and your unit should rest comfortably on the temporary shelf making it much easier to slide out. Makes it even easier to slide in since you aren't trying to hold the dumb thing in place while inserting the screws.

This may be easier to visualize than describe. If there is any interest, I can do a quick PDF.

And some day I'll tell you how I get my 250 lb. FRR-59 into a rack by myself.

Well the crystals can be obtained from the normal crystal makers.

For the air variable - I would try Oren Elliott Products (largest mfg in US) - who supplied air variable capacitors for many manufacturers (Heath, Collins, etc.)
http://www.orenelliottproducts.com/capacito.htm

Gary is correct. Those procedures go back as far as I remember,
and are not necessarily found in owners manuals.

From a safety standpoint, the manufacturer would rather have the
B+ removed for adjustments. But,
if the neutralization is set correctly, the maximum output and minimum
plate current should coincide.

I happened to have a 1976 Handbook handy. Page 163 details
the grid current method of neutralization in a screen -grid amplifier.

"... As a final adjustment, ... the neutralization adjustment should be
continued to the point where minimum plate current, maximum grid
current, and max. screen current occur simultaneously."

Ended up with a large 4 rail rack, which will lend itself to installing
paralled
runners along the sides for the receiver chassis's to rest and slide on.

Still leaves the problem of carry the AR-88 around the room, though...

Anyone ever play around with a B&W 370 or the Central Electronics sideband slicer units? Interested in comments, how well they worked, experiences, and what receivers you might have tried them on.

I have a CE that's going on a SX-28A eventually, and I am waiting for a BW 370 for my AR-88.

I used a CE Signal Slicer with a HQ140X. It did an outstanding job. The slicer also had a notch filter, which worked fairly well too.

They are all good. Most of the time the am boys (and girls) removed these accessories because of the "clutter". The older receivers are limited for sideband use by high frequency oscillator stability, so the combination may not be as good as a more modern receiver with crystal controlled front end.

If you like to twiddle dials, they are perfect. Audio is usually very good.

Wrap the fuse with Reynolds aluminum foil. Don't use plastic-wrap, that won't work. Insert the fuse, then rotate all knobs for max out.

Jump the screen drop resistor and you'll get about 190 Bird watts out with good swing.

I'd install a Christmas Tree in place of the 6X4 rectifier for more output.

Wrap the final tubes with a layer of Teflon plumber's tape. In case the glass shatters during tune-up, the shards won't get into the bandswitch.

Replace all caps in the speech amp with Vitamin Q's for better sonic clarity.

Good Luck

Does anyone know of a retail vendor that would sell the Murata ceramic filter CFJ455K5 without a $250-$500 minimum order? I just need one piece for a Ten-tec radio. So far, I have exhausted every lead that I had.

Apparently, these filters were very popular, common, and inexpensive a number of years ago.

Thanks Jim

I know that I can buy crystals from the "usual suspects".
I was hoping someone had them lying around.

The air variable cap needs to come from a 2B. It's not
an off-the-shelf type of part, plus it has a built-in
vernier drive and the right shaft diameters, so I can't
use a generic part. Having one custom-built would cost
more than the radio is worth.

So... the search goes on...

I have an RME-4350A receiver with the RME-4301 Sideband Selector. The setup works well, but the 40dB unwanted sideband supression seems a bit optimistic. The critical issue is the accuracy of the phase-shift network. I suspect that component drift over the years has degraded the performance of these devices.

You will blow the fuse if you spend too much time with the key down. I used to run RTTY, reducing the power to 60 watts or so. You would be safe tuning up in TUNE position, but need to go CW for the full power touchup. There should be no reason to lean on it for more than 5 seconds at a time.

Nutralization is easy. Adjust bias for 55 ma. no drive, then tune up the radio normally on 28 MHz. and switch the screen grids off on the back panel and adjust neut cap for minimum output on a receiver. Use an insulated screwdriver or you will burn out the plate choke. When you are through, plate dip and maximum RF output should be very close (but not usually exactly coincidental) and maximum RF output should occur at 225-250 ma. IP. Always tune rig for maximum RF output for cleanest signal and reduce drive for your needs.

I'd also suspect you almost melted down the 6146s with that sort of
plate current. They probably turned cherry red, and arced over,
blowing the fuses. Read the manual.

Pete

3132. Front Panel Touhups

Newsgroup: rec.radio.amateur.boatanchors
Date: 2005-07-21 00:49:05 UTC
From: Uncle Peter <radioconnectionNO@cox.netSPAM>
Message-ID: <6iCDe.156684$go.139282@fed1read05>
Source record: 17123

The patient is an otherwise nice Globe Scout 40A, but it suffers from
the common malady of moisture getting under the enamel paint
on the front panel, which caused some of the paint to bubble and
flake off. There is some residual rust on the now bare metal.
The problem seems worse at the edges, as would be expected.
Here's a real closeup shot, which makes the problem look worse
than it is:

http://antiqueradios.com/albums/temp/40_A_panel_rust.sized.jpg

Question: What is the best way to handle this? My first impulse is
to have a decal set made, strip the panel, and repaint.

On the other hand, I'm wondering if I can have some paint matched
to the original color, and using an artist's brush, touch up the bare
areas as needed.

Or, should I mask the otherwise good decals, and spray the whole
panel with a fresh coat?

I'm also wondering how to match the sheen of the new paint to
the now "dead" flat finish on the old enamel? Can I overcoat
the old and new with some clear acrylic to balance out the sheen?

Ideas?

Pete

3133. Re: Fuse for TS-830 & Neutralization ?

Newsgroup: rec.radio.amateur.boatanchors
Date: 2005-07-21 03:23:52 UTC
From: Gary Schafer <gaschafer@comcast.net>

Source record: 17124

As Pete said "it is in some of the handbooks". It is also in some manufacturers manuals.
It is much easier to do than disconnecting the plate and screen voltages in most cases. Often disconnecting the screen voltage is a real chore.
Also all the shielding is left in place and the procedure / check can be done quickly on any radio.

Some radios can not be perfectly neutralized so you may not be able to find a position where max output and minimum plate current occur but you can usually get close.

sometimes using a little less than full drive makes things more sensitive and it is easier to make the adjustments.

I have seen radios that would not neutralize properly and I had to change the values of the neutralizing capacitor to either a larger or smaller than the original.
This can also happen if you change the type of 6146 tubes used. The 6146B verses a plain 6146 for example will require a different value of neutralization capacitance. If the original capacitor will not tune far enough then it will have to be changed to do the job.

When watching for maximum grid current and minimum plate current for proper neutralization there is an exception.. The Collins kwm2, 32s1 etc. use negative feedback in the final and driver stages. When properly set up and neutralized the grid current should dip slightly when the plate current dips on these radios. This is due to the plate voltage increasing at plate current dip (a normal thing in any radio) and part of it is fed back to the grid out of phase to create the negative feed back. That out of phase voltage causes the grid current to decrease.

Well not trying to be glib or what ever....

Have you checked around with folks who "collect" older radios?
Some items that collectors balk at buying are items that have been
"refinished".
If your looking to just use it... I gots no advice. But I would check into
the
wisdom of redoing the panel. If the ol' radios are any thing like old items
on
the antiques TV shows, refinishing and refurbishing kill the value of the
antiques.

Good luck 73 Gary WB9SMX@arrl.net

I have to agree with Colin. Although they'll all work just fine, the final results may be less than what you may be expecting. Used with an R-390, 390A, et al, you have a fine combination. Also, I'll add the Hammarlund HC-10 to the list.

I have just come into possession of a Loral RF switch. It is a SP3T variety with N-connectors. It also has a make MIL circular connector (14-15) for the power and indicator connections.

The part number is 9033-D239-D2D-7A2.

I have Googled ad nauseum without results. Does anyone have any information on the wiring connections and/or the specs?

Thanks for your help and 73,

Joe

Pete,
The picture was worth 1000 words. If you're going to keep this for your own collection and re-sale is not an issue (at least at this point), I'd say go to your local automotive paint emporium and have a small batch of paint made up. RCarefully refinishing that small area is not at all like trying to do the whole panel. Any reasonable collector (myself included) would appreciate and necessary repair like you'd be doing. Unlike pieces of vintage art, etc. vintage electronics aren't value-destroyed by well-made repairs. That's why I'd say do just the small area that's necesssary. Regarding remarking, if you can match the size and font... have at it! Although nice to use, standard DATAK dry transfers are all too obvious. Sometimes a complete refinish is indicated, e.g.: a rusted out Halli. R-48. I had some decals made up for several of those speakers and did a complete strip, pickle, and repaint. Yeah, they're acceptable but I know the truth... so to speak, but they're far better than they were. Regards and good fortune with the project. de Jeep/K3HVG

You'll probably never find the originals. You may find can caps that are close in value but form and fit may be an issue. If I may make a suggestion; either gut the original cans (if so equipped) and re-stuff with the equivalent, smaller Xichon (sic) caps from Mouser or just wire the new ones on the bottom of the chassis, out of sight. The thing deserves to be back on the air!!! de K3HVG

One thing to check on this radio is the rubber grommets used to insulate the chassis from the case. They are usually dried out and need to be replaced. Use an isolation transformer when servicing this radio. If the grommets are bad there can be a direct connection to the case from the AC line. I have a copy of the original manual, it's not great but I could scan it.

And I have one on a shelf. Have wondered how desirable they are to
collectors.
I am in no hurry to sell it so haven't checked Ebay.

All of you are right as to model etc. I have 4 of them, and use one regularly with my Drake "C" line with great audio reports. I've seen them go on ebay for as little as $18.00 to as high as the 90's for some reason.

Just my opinion, and of course I could be wrong.

Salutations to all. I'm a newcomer to this newsgroup but I'm hoping someone can give me a clue as to the relative worth of the following items:

1. One Gates M-4990 Frequency Monitor. Unit looks to be late-50's or

early-60's vintage, used at a station broadcasting on 930 khz. Gray steel cabinet, tube circuitry.

2. Two McMartin TN-77CB FM subcarrier recievers. These were placed in stores and restaurants who subscribed to the station's Muzak sub-carrier. The station that originated the subcarrier broadcast on 93.3 mhz. Steel mesh cabinet with tube circuitry.

3. One McMartin LX-40A solid-state mixer-preamplifier, used for remote broadcasts. Unit has 4 XLR mike plugs on back, with level controls and a horizontal VU meter on front.

4. One Zercom Maxi-Two remote broadcast telephone interface. Unit accepts two mikes via XLR plugs on rear with LED level indicator and rotary dial on front. Headphone plugs, receptacle for 8 D batteries and phone plug on rear. Solid state, probably used with item #3 above.

5. One NAD AM/FM stereo tuner, used as an air monitor at the station which used the aforementioned items. Linear scale dial, solid state. (probably does not qualify as "vintage" but fully functional)

All items described above appear to be in working order. The tubes light up and nothing smokes, which is as much testing as I've been able to do with them. Somebody make an offer!

Hi,
We are currently putting together a working WWII period display based on a signals office and are looking for a Creed 7 and a Marconi Undulator. Can anyone help?

Also if anyone has anything wartime or slightly later they would be prepared to sell at a reasonable price we would be interested, we have several CR100 and AR88 receivers so far and I believe one intention is to put together a triple diversity setup with the 3 CR100s.

Would also like a BC610 but not sure how rare these things are.

Should point out I am not the expert, but we do have a licensed one who is building the exhibit!

The link for the museum is that we have several period ex-military gensets which will power the display. The plan is for the site to be on the air at weekends.

Thanks
Paul Evans

I noticed he forgot to include my steam powered receivers in his book.

I was hoping that the inclusion of the psi gauge on the R-390 series of receivers would have been noticed by now.

Want is a "Marconi Undulator"?

I'd don't think I have one, or at least if I have I don't know it ;-)

I do know someone who had a Creed 7 looking for a good home- I'll see if it
is still available. However, it is in Kent so would need collecting.

Sample tape shown at http://jproc.ca/rrp/akla.html

We have several "Friends of the Museum" Kent way so collection no
problem if the Creed is available, good home guaranteed.

Thanks
Paul

OK, I'll try and pop along to visit the owner and ask him.

You could also try the "BARTG" group- British Amateur Radio Teledata Group,
the Creed 7 was the "standard" amateur teletype before computers came along.
Radio amateurs being radio amateurs, there will be several in a
loft/garage/shed that are no longer used.

Almost all 388's that've belonged to real people & used by real MIL units have some minor mod(s), most of them useful. Ex: mine has the old popular QST/Paul Lee product detector mod which is great & also reversible if desired by an uptight homosexual person who doesn't like enjoying a nice stable tube rcvr with good audio on SSB. Hard to know what the added socket'd be for as it has it's stock connections for the old TX/RX usuals. The orig handles wing outward, hard to imagine others that fit the panel holes? Many, including mine, lack the top cover. Might someone have stuffed a nice mechanical filter (J4) in it too? (more bux) I love mine, so I want 7 million dollars to part with it. :-) Maybe $300 is realistic for a quick dump with the chassis mod.

3206. Fluorescent work bench lighting

Source record: 16997

I have a couple of 4 tube flourescent fixtures in the workshop that the builder put in 13 years ago (meaning they're the cheapest ones you can buy!) and have no RF hash whatever from them. In previous homes, I always had to install line-rated bypass caps in the fixture and that would cut down the noise almost completely.

Inside the fixture I install a packaged noise filter from some surplus device, and that seems to work fine. If the receive antenna is some distance away, and shielded, where it comes into the shack, there is no problem.

It is the light dimmers that raise havoc quite a distance away.

If I "really" need to cut out the fluorescent, then I use the magnified lamp
on my workbench with a regular 60 watt bulb in it. It usually provides "me"
with ample light and if not, can be aimed to the area where it "will".

I have a boom desk lamp and replaced the 40 bulb with an 11w flouro - you
know the "folded up" type that screws into the socket. NO rf hash, and it
runs very cool.

BTW, in the past I found that these globes desensed the IR remote on my TV
(I guess it couldn't handle the flicker rate).

Well that's true but I think the antique road-show people are in a
different reality. ie. They're nuts.

Some of the radio folk might be tending towards that but radios are
nothing like the antiques on TV.

All of that antique stuff is way overpriced. I'm not disputing that
some whack-job collector will pay tens or hundreds of thousands of
dollars for the weird lamp, table, or wooden chicken.

I'm saying that there is no reason for those items to be priced that
high. Especially since a lot of it could be duplicated to a 99.9%
acuracy by a skilled forger or craftsman.

None of the radios that we discuss here have anything like the
valuations of "antiques". If they did, a KWM-2A, "Vietnam
War Antique from the Last Century, Cannot be duplicated, even by
the most skilled craftsman as the parts are no longer made.", would
be priced to the hundreds of thousands of dollars.

They're not. An M-2A is maybe $1,000-$2,000, Less than the
original price. That era Corvette or Porsche was less than ten
thousand dollars.

If just adjusted for inflation, an M-2A should be ten to twenty
thousand dollars.

If the collector people discover that we actually use "Military
Communications Gear from the Vietnam or Cold War", they would throw
money at us to get this stuff.

I'm counting on that not happening for a while and have been slowly and selectively buying a few interesting items.

I hope to make the Howard County BRATS hamfest this weekend. Likely someone who doesn't think like I do will have an interesting boatanchor for sale.

About 40 years ago, I saw a KWM-2A that had been modified to include a built-in 312B-4, or at least that's what it looked like. There were two horizontal slots cut below and to either side of the PTO knob. In each slot, the fellow had added the two levers from the 312B-4.

Would a collector turn it down? Probably, but I thought it was an interesting radio.

Anyway, boatanchors are interesting radios. Fun to use. It's nice to fix them up. I'm not into modifications though.

de ah6gi/4 at least none that can't be reversed.

I have both a working and a non-working NC-57 and can assure you that is not the transformer used in the NC-57 receiver. Sounds like you have some kind of a buck-boost transformer. I have never seen a transformer with specs showing the working voltage to ground. Pretty strange unit.

You must not work with milspec equipment much - VERY common to see such
ratings on equipment made for the government...

best regards...

I have a partially restored AN/TRM-1 combination signal generator and test set. I have restored everything except the VHF/UHF module as I haven't needed that part of it. It is modular so if you want to complete the restoration, it wouldn't be too difficult.

Pictures available.

$50 + shipping (it's heavy)

Well there you got a couple of responses. Hope you have luck with your ol' rig.
I just tossed out my 2 cents worth to get the string going. I was kinda curious
what others thought too. I don't have any toob rigs but them 807's just ain't
what they used to be what with the light versions and all. Cheers Gary WB9SMX

agreed, but the manufacturers also state duty cycle along with the specs.
the less time it is on the more power it can put out safely. but I bet with
a big enough blower, the right high voltage and operating current it could
almost do anything. but I was originally stating the ssb and cw modes which
is the norm, you can tell by tuning the bands and hear how many stations are
running rtty when there is no 'rtty contest'. John

From: K3HVG <jeepp@adelphia.net>
Message-ID: <9PidnSegpMjPDHffRVn-tw@adelphia.com>
Source record: 17019

I have a number of excess Greenlee (and a very few Sekonk) radio chassis punches. I'd like to see if I can trade for those I don't have. For the "D" type punches I need, I can trade 2/3 punches of mine (except for the 2 1/4).

I have extra:
1/2 inch round (3 extra)
7/8 round (3 extra)
9/16 round (1 extra)
1 inch round (1 extra)
1 1/4 inch round (3 extra)
2 1/4 round (1 extra)

I need:
1 3/4 inch round,
"D" punch for panel mount fuse holders (1/2" as I recall),
"D" punch for BNC panel mount connectors (3/8")
punch for DB9 panel mount connectors.
Also maybe a 3/4 inch round.

Thanks.

Hi gang,
While this radio is not exactly a boat anchor, I figured this group would know of it. Back in about 1982 or 83, Panasonic offered a table top general coverage receiver. It used a PLL type system for the LO. It had a large knob on the front that selected 1MHz increments and another knob that tuned within the band. It may have also had some type of lock control that you had to fiddle with when changing bands. I believe it had 2 internally mounted speakers, one at each end of the unit. Does this description ring any bells? I'm looking for the model number and if they ever show up on the used market.

Thanks!

I hate conventional fluorescents as high-detail worklights, EMI or not. I'm running the squigglies seen at HD for $8+ that I got a mess of at Building 19 last year for $0.49 apiece ("equivalents" 40/60/75/100w incandescents). I love 'em & they're all over my house & e-shop (but not the mechanical & woodshops). Insignificant or no EMI, nice K-color, cool-running, frugal on juice, and a 1/2 min warmup from lower brightness that's nice on the eyes when entering a dark space. Wish I'd bought 50 more. Only 1 dead in a year. They hold up great in outdoor fixtures @ -20F, too. Also great in track cans made for 75w floods. My juice bill now looks like it's from 1960, I only bother to pay it every 3 mos now.

Even found 2 dim-able "75w" ones but no more since or anywhere, at any price. :-(But I found U can use the normal ones (at least of this LiteWiz Chinese brand) in dimmable tracklights with, say, 2 of 'em plus a normal 75W spot, & they will just come off/on at a low dimmer setting while the conventional spot bulb will dim for the task or accent area. Way cool, a complex & useful dimming/not dimming scheme for free. So, the package warning "Do not use with dimmers" is up for grabs.

I also bought dozens of the other variants of these bulbs for a large rental property I was managing at the time, such as the vanity globes, flood-style versions, and other "folded" type "looks like a normal bulb" versions. They are all garbage & the plain squiggies work great in their places.

There is more than one size base (the while plastic affair enclosing their electronics) for various brands/models of these bulbs, and the differences are subtle to the eye but many will not fit some fixtures because of it, so look closely or try one in several fixtures B4 you buy 20. My cheapies are all smaller & go in almost anything, but the ones I see around at retail won't.

They also "say" not to burn 'em base-up, but they work perfectly & reliably this way; they just come up to full brightness more slowly.

The little size is great in a bench magnifier lamp & has half the glare of a "soft" incandescent. I have enough trouble seeing tiny details with the magnifier AND reading glasses, and it's a lot better now.

Shop the big closeout/buyout places, lots of good shop things. Got the best rubber mats ever seen, brown or red honeycomb commercial grease-resistant kitchen product 2' x 3' sections, American made, retail >$150 for $6 apiece, nice on feet & outstanding dielectric mat. Lined the sailboat cabin sole with 'em sliced in half & fitted, no more cabin carpet cleaning, outstanding traction wet or dry, hose 'em right thru into the bilge. All I need now is a rich woman to pay the marina fees to truck & put 'er in the bay<BG>. Put more half-slices around the kitchen tile floor at work areas, best thing that ever happened to someone who cooks like man. Makes a helluva doormat. You never have enough $$ on you when you find stuff like this, and of course it is gone by next week.

The best bench lighting of all is sunlight. I never saw the sense in backing the bench with shelves & test gear, it seems stupid to me & I have all that on a heavy shelving to my right where I can reach & use all of with without making a rat's nest of leads over the work. I also never saw the sense in working mostly at night. Instead, there is a big double casement window right over the bench. Good for the eyes, ventilation, and the spirit.

Have a very nice and all original NC-100a general coverage receiver for sale. It is practically spotless and has all the original componets and is in working condition. Included is the matching speaker, also in excellent condition. I can send photo to those interested. I would perfer pick up in the Centeral Washington state area but, will consider shipping all at buyers expense. Price for this jewel is $350

3251. Vacuum Tube Filament Voltage Question...

Newsgroup: rec.radio.amateur.boatanchors

From: Jim Flanagan <jflan@tampabay.rr.com>
Message-ID: <MqbHe.28722$iG6.733@tornado.tampabay.rr.com>
Source record: 17039

Hi...
I have very little experience with vacuum tubes and would like to know what is an acceptable tolerance on the filament voltage. I am planning on using some 6U8A tubes in a homebrew receiver. The data sheet that I saw mentions no tolerance on th 6.2V filament. Would +/- 1V be OK? Any help would be appreciated....

Thanks..
Jim

Cobra has the 150 GTL DX 10m AM/FM rig that looks identical to their 11m rigs right down to displaying 40 "channels." I saw one on ebay already for auction in the ham radio listings. The seller says he bought it thinking it was the state-of-the-art CB mobile and found it was a 10m rig.

Their 200 GTL DX 10m rig is just as flashy with all the chrome and bright metal, but has a frequency display.

Cobra's design is a throwback to the 70s and it shows on their "new" 10m rigs with the red LED display.

I don't expect many current hams to be purchasing any of these rigs anytime soon. Look for renegade CBers to buy up these radios for their "freeband" needs.

Ed

Thats a bit too much...but not catastrophic either. Figure on about +/-
10% max with a fresh tube. An older wornout tube might not like even
that much reduction.

Message-ID: <FOuHe.860$_t.635@okepread01>
Source record: 16946

I have 4 Bird Slugs for sale that are not working. They are:
2-100C's/ 100 Watts for 100-250 MHz
2-100H's/ 100 Watts for 2-30 MHz
They look good, except one of the 100H's has been disasseembled.
They don't show any reading on my Bird 43 Wattmeter.
I know that these can be repaired, but I am not up to it.
I am asking $45 for for the lot, shipped in the lower 48.
Thanks, Charlie Hugg, K5MBX

Agreed: the filament is just like a lightbulb, and increasing the supply
voltage will *drastically* shorten the life. (Reducing the voltage will
extend the life, similarly, at the expense of reduced output. I think
it's something like 12% overvoltage will cut the working life by 50%,
but I may be mistaken on that.

Chris.

I kind of agree that higher filament voltage is not good. But 50% of the working life really doesn't say anything. If a tube is good for only 2000 hours then it would drop to 1000 but if it good for 100,000 hours and drops to 50,000 I would say we really do not have a problem because 50,000 hours is far more than I will ever have any boatanchor on.

So what are the mean time before failure of most tubes ?

Depends on the circuit, but I recall that one of the premium industrial
brands were called 10,000 hour tubes. They had gold plated pins, an
extra large getter, and a special high purity cathode that wasn't susceptable
to "cathode interface", the nemesis of tektronix vacuum tube oscilloscopes.

10,000 hour tubes were identified by having type numbers from 6000 to 6999.

NOT. The resulting reduced emission shortens, not lengthens, tube life
in most cases.

> not certain...Help me bring this lady back to life...Pleas answer in this
> newsgroup as my email is not working correctly

I looked at two on-line schematics and both are so bad it's hard to
determine all the connections.

I don't know what you mean by two connections, pos and neg. It looks to me
that there are connections for the AC switch loop-through (1 and 2), Hi
voltage, I think (11), speaker (7), and others that I can't read.

I hope you receive better info than this, but if not maybe you can trace
what's what by starting at the external power supply. It should turn on if
you connect through the AC switch wires.

Good luck.

Don

I've heard that, and it makes me wonder if the reduced life is only as viewed with the tube running at the reduced voltage. If you take a tube that has reached end-of-life with a reduced heater voltage; I wonder if it would still have a bunch of time left at the correct heater voltage.

I suspect it would. In the early days of radio, filament voltage rheostats were sometimes used to control volume. Also as tubes aged the voltage was cranked up to keep it usable.

Depends on the type of tube -and the service it's in. For instance -
many large transmitter tubes are run at 100% filament voltage for their
1st 100 hours - then reduced to (usually) 92% and run until their
emission starts falling off - usually seen in PAs when the tube is
having a hard time making full power (and grid current has dropped off
from "usual"); - or in the case of modulators - when peaks get
clipped... then the filament gets raised back towards 100% to restore
proper operation. When 98% is reached - time to order new tube(s) to be
sure they're available when the installed one(s) croak.

Running tubes such high power tubes (like the 3CX2500, 4CX3000, etc.) at
92% for as long as possible adds years to their life.

Keep in mind, however - these tubes are designed for such service.
Under powering many small signal tubes can cause damage to the emitting
surface (cathode) - so it's best to run them closer to design value.
Basically - if a tolerance for the filament voltage isn't given -
assuming a tolerance of +/- 5% is conservative - while +/- 10% is
pushing the the tube pretty hard; and shouldn't be done.

Tubes designed to be run "cool" like very large power tubes will be so
noted by the manufacturer or rebuilder as the case may be.

best regards...

Forgive me if this comment is out of place, but I think I see a trap here. It is very easy to use the terms "heater" and "filament" interchangeably. They are two entirely different animals and should be treated accordingly. The comments regarding reduced life at reduced voltage would probably apply more to indirectly heated cathodes (heaters) rather than directly heated cathodes (filaments).

The reason for dropping a high power transmitter tube's heater voltage when running under power is to compensate for the heat added to the cathode by the anode current, and the reflected heat from a toasty hot plate. The hot anode acts like an oven surrounding the heater, and as such forces its temperature up. If you don't reduce the heater voltage from the nominal value, the heater will overheat, and cathode life will be reduced.

Whether operating with reduced filament voltage is detrimental seems to depend on whether the tube is an oxide-cathode type.

Pure tungsten or thoriated tungsten filaments do not suffer damage from filament under-voltage, while oxide cathode types do.

I think this also depends on the tube.... as I recall it is much less of
an issue for power tubes than small signal tubes....

Sounds more like it went for what a seller wanted and a buyer wanted to pay.

Not a lot of activity on yours - are you SURE the other seller was
'unlucky'?

3277. Re: Vacuum Tube Filament Voltage Question...

lbrty4us@aol.com wrote:

> You haven't posted anything contrary to the +/- 10% rule given by RCA.

Geez, Frank:
I was answering a specific question posted earlier: "If you take a tube that has reached end-of-life with a reduced heater voltage; I wonder if it would still have a bunch of time left at the correct heater voltage?"

I noted that the answer was yes - and that it is a common (recommended) practice with certain tubes in certain types of service (I.E. running at reduced voltage until the inevitable emission fall-off required gradually restoring full filament voltage).

I'll further note that many tube testers (B&K 700 series, for instance) have a "Life Test" where the filament voltage is reduce by some amount. If the tube is "fresh" emission falls very little. If the tube is "long in the tooth" - emission falls significantly. This shows that tubes that are in trouble at reduced voltage can still (for a time) perform OK at "rated" filament voltage.

This is all I was addressing in my earlier post; and demonstrate even further in the above.

--- So what's your point? Where did I imply I was going to comment on RCA's "rule" - contrary or otherwise?

But now that you make an issue of it -- and so as to not disappoint you - I will post something "contrary" to RCA's "rule":

Mullard's general recommendation was +/- 5%.

Were RCA's tubes that much "better" than Mullard's that they could stand twice the variation?

Or was Mullard more concerned with quality and how their stuff was used-- while RCA rated their tubes as being just mass-market junk?

That oughta stir some crap... Happy now Frank? Something to sink your ever present teeth into?

Sheesh.

NAW.....

STAYAWAY FROM THERE... TOO MANY CONTESTERS, DX HOUNDS AND SPEED FREAKS -
THEY'LL STOMP ON AND BLOW AWAY YOUR LITTLE MICA TOY....

7.045 WOULD BE A GOOD FREQ - CLOSE ENOUGH TO QRP CALL FREQ 7.040 - BUT FAR
ENUF AWAY SO YOU CAN HAVE NICE RAG CHEWS. 7.046 IS GOOD TOO BUT STAYAWAY
FROM 7.047 .048 AND .049 BECAUSE OF NIGHTLY ARRL W1AW QRM.

ALSO STAY AWAY FROM 7.050 CAUSE THERE ARE A LOT OF NETS HERE. 7.052 TO
7.058 ARE ALL GOOD FREQS. .57. 58. .59 ARE CLOSE TO THE FISTS CALLING FREQ
7.060.

THE TRICK IS TO CALL CQ NEARBY A BUSY FREQ AND LET THE OTHER GUY SWING A FEW
KC UP SO YOU CAN CHEW THE RAG IN THE CLEAR.

STAYAWAY FROM ANY FREQ ABOVE .60 AS IT'S IN HEAVY USE FROM SSB'ERS FROM
SOUTH AMERICA, CANADA AND JAPAN. ALL USING VERY HIGH POWER AND
OMNI-DIRECTIONAL ANTS.

THEY CAN HEAR YOU - THEY JUST DON'T GIVE A SHIT... UNTIL YOU RUN A KILOWATT

AS FOR 20, SAME THING APPLIES - ANY FREQ ABOVE 14..050 IS GOOD. 14.060 IS
FISTS CALL FREQ AND BECAUSE NO SSB IS ALLOWED HERE ANY FREQ ABOVE OR BELOW
.060 IS GOOD.

HEY DON'T FORGET 80 METERS !!! SURE IT SUCKS NOW BUT THIS WINTER IT WILL BE
GREAT. ANY FREQ HERE WILL DO NICELY...

LASTLY, DONT FORGET THE NOVICE BANDS - 3.7 - 3.75 AND 7.1 - 7.150. STILL
SOME ACTIVITY THERE - ALOT OF OLD TIMERS WITH OLD NOVICE GEAR STILL RAGCHEW
UP THERE ESPECIALLY DURING CONTEST WEEKENDS. MIGHT BE WORTH IT TO HAVE A
ROCK OR TWO FOR WHEN "CONTEST QRM" GETS BAD.

If you reduce B+ and screen voltages proportional to the fil. voltage
reduction, you negate the problem of depleting the space charge and
stress-cracking the oxide coating (assuming there is a decent amount
of emission left, of course). Yes, output is reduced.
But I think most of us know the difference between
100 watts and 70 watts isn't worth mentioning.

I have a set of 3 Millers for the range 1400-1600. They are
sitting in an old converter that I built nearly 60 years ago. The numbers
are hard to read the way they are mounted, but one is definitely 912W3,
another looks like
912W4 and the third has the label close to and facing the front panel so I
would have to remove it from the chassis to get a reading.

Thanks Miki, however please don't go to any trouble. I am simply hoping someone would have an old Miller catalog which would call out the filter response specifications, etc. That would be good enough for me.

$20,000 is the going price for the KW-1. I sold one 20 years ago for an estate for $15, 000 - before e-Bay.

Bet there is a buyer, and consider how much better this investment is than if someone had purchased $15,000 of Polaroid, Enron or Xerox.

$20,000 is a very realistic starting point for a KW-1.

G'day!

I recently acquired a Tektronics transformer #120-103 that came from a scope, sight unseen and model unknown.

Would anyone know what the model # of the 'scope was that used this?

I've been downloading manual after manual at BAMA and have found no model 120-103 as a power tranny (so far).

Just trying to save some bench testing ;-)

Thanks!

NO, they go for around $12,000 - $14,000 among reasonable people.
The ones who pay $20,000 are buying them to send to antique collectors
in Japan for even more!

You can always pay more for anything on eBay.

That ONLY works if he has a lousy receiver.

A decent receiver is not going to hear a signal that is 500 to 1000 Hz
away. Your idea that guys on 7040 are going to listen for a signal 5
kHz away might have been a good suggestion 40 years ago, but not
today. It ain't happening.

The way ARRL is headed, CW and AM will be illegal in five or ten
years anyway!

12 to 14K is for one in fare shape. By the looks of the pics, this one is in very nice shape. As stated, 20K isn't that far fetched. I bet it goes for near 30K when over.
Define "reasonable" for me. If I bought one for 20K, I would be keeping it. But, what's wrong with buying low and selling high?

Folks, if you want to invest, get yourself some nice, safe, not to mention unbreakable-and-non-rusting bonds or mutual funds.

Anybody who buys radio stuff (of which I have way too much) for investment purposes is in serious need of professional therapy.

If I had bought $15,000 worth of MSFT in 1985, I could probably buy the world's supply of KW-1s and then cruise off in my spoiled-brat boat from my condo on St. Barts for a vacation in Hawaii.

If I had bought one of these for $15,000 in 1985 and could now sell it for $20,000 (figuring in storage fees etc. as needed) , well . . . you do the math. Maybe I could buy a medium-sized plasma TV. Not the most thrilling return for a 20-year investment.

If you like old radio stuff, buy it for love, not for money. And don't bet your retirement or your kids' college money on it :-)

Regards,

Phil Nelson

"If I had bought one of these for $15,000 in 1985 and could now sell it for $20,000 (figuring in storage fees etc. as needed) , well . . . you do the math. Maybe I could buy a medium-sized plasma TV. Not the most thrilling return for a 20-year investment."

Well, I was not talking about storing it, but rather using it. So, you would get 5 years of enjoyment from it, while using it every night. Compare that to a new Dodge truck. What is the value of that after 5 years?

So, when we talk Collins, it is not some radio that is stored in a bank vault, it is used daily, then sold when you are moving on to a retirement home for more money than you paid for it. Maintenance costs are almost zero. Of course if I had purchased a P-38 when they were still $7,000, I could buy a lot of KW-1s now.

Silent Key Auction for Herb Petereit, W0AFY. If you knew Herb, you knew that he was one of the "old timers". One of his first jobs after moving to Omaha, Nebraska, in the 60's was building Galaxy V's at World Radio. He knew his gear inside and out, knew how everything worked, and took a lot of pride in keeping everything running in top shape. For many HAMS in the Omaha area in the 70's and 80's, Herb was the guy to go to when you needed help.

Herb passed away on Veteran's Day, November 11th, 2003, after a severe bout of pneumonia. He was 71 years old.

This auction is for a very nice Cornell Dubilier Ham III/CD-44 eight-wire antenna rotor controller. My dad used this to control the Tail Twister rotor under his 10-element tribander. Some fellow hams in the area purchased the tower with rotor and antennae, but for whatever reason did not take the controller. It's a very clean unit and as far as I know, in perfect working condition.

My Dad,

W7US

Willis George Allen was born April 5, 1923 in Cleveland, Ohio. He passed away July 20th, 2005 at his home in Tucson, Arizona. He was a loving father and husband who will be greatly missed. My dad served with the navy in WWII in the South Pacific in nine major battles on the USS Biloxi. Dad retired from Tucson Electric Power Co. in 1984. Dad was a life long member of the American Radio Relay League. Bill Allen is survived by his wife Greta of 57 years and his son, William (Bill) Allen. His daugheters Marguerite McCann, Holly Hancock and Beth Pfeifer. Also grandchildren Zachary, Logan, Treveor, Sean, Matthew and Laurie. A great man who is to be forever missed. The family memorial was private. emails to son, "Bill" will receive respones from williamdallen@cox.net

Thanks and 73's

Early TV restoration has the photos for their paper capacitor process
http://www.earlytelevision.org/cap_replace.html

For the restorer ... toward Smithsonian levels ..... it is not uncommon to find older radios where the original capacitors were replaced with more modern (usually post WW2) versions. In order to restore the chassis to an authentic (as possible), use replacement labels.
Remove the paper label from one of the pre WW2 capacitors in the set and scan it into your computer. I then use Photoshop (or other graphics editor) to create new labels for the replacement capacitors. Using Photoshop, you change the capacity and voltage on the label to match the values needed. You can remove the post WW2 replacement --- glue the new label to the capacitor -- and reinstall in the radio or TV.

Bill Turner was making the old multi-section cardboard tubes - but due to his health problems -- he is not currently taking orders.

[snip]

How many people will want to buy the Collins? Younger people now consider electronics as disposable as an old PlayStation or an IBM 486. They listen to music, but it's on CDs or MP3s. They aren't radio listeners. For the most part, they aren't radio amateurs, anymore. More than that, there's a real chance digital radio may be well on it's way to making all the analog radios obselete.

I'm sure there will still be a few of today's twenty or thirty somethings who want an old Collins. But I really doubt there will be a large number of them, and they will have plenty of radios to pick from.

Bill,

I'm very sorry to hear of your fathers passing. It's been about 20 years since I worked him but I recall his special note on his QSL card that I worked him from West Virginia to complete his Satellite WAS. That special QSO and his distinctive "US" callsign always drew attention when looking back over cards.

If you check back, I was WB2DIN/8 back in those days.

<snippety-two>

You're absolutely correct. What you're seeing is an odd state of
mind in which unbuilt Heathkits -- ANY unbuilt Heathkits -- take on
"collectible" value vs. the real value of what they'd be worth once
assembled.

I've seen the symptom many times, though I consistently fail to
understand it despite the fact that I've built many a Heathkit while
they were around.

Keep the peace(es).

More house cleaning.
Is companion to SX-62A (?) I forget.
Nice condx, has Fidelity, Comm switch on front.
BIG boy size.
Can do pix if wanted.
$125. shipped from WNY

FOR SALE: RADIO AMATEUR CALLBOOK MAGAZINES

These callbooks are in good to very good condition for their age; the covers are somewhat worn and there is some yellowing of pages, and a musty ordor. There are no torn or missing pages unless noted below. The 1947 through 1959 callbooks contain foreign Amateur Radio Callsigns, and US. The 1961 through 1968 callbooks contain US and US possessions Amateur Radio Callsigns. Prices include mailing "media mail" to US addresses. Please ask for shipping cost if mailed outside of US. Prices are: 1940's - $35.00 each; 1950's - $30.00 each; and 1960's - $25.00 each. I accept payment via PayPal or Money order.

Summer 1947

Winter 1948-49

Fall 1949

Summer 1950

Spring 1952

Fall 1955

Summer 1959

Fall 1959 - front cover is coming loose but can be reinforced with clear tape.

Fall 1961

Spring 1962

Winter 1963-64 - front and back covers have some tears

Spring 1966

Winter 1966-67

Winter 1967-68 - very slight water damage to front cover and first few pages
Thanks, Charlie Hugg, K5MBX

The Chinese are sitting on $200 Billion of US dollars which are
becoming increasingly worthless. First they bought the British
automaker ROVER, then tried to get Unocal, and now are talking to
Marconi Communications, the Brit defense contractor.

See all those plastic doodads in your closets? See all those
Chinese-made clothes?
How about TVs and stereos? That's how they'll end up owning everything

3328. Drake L4-B question

Newsgroup: rec.radio.amateur.boatanchors

Message-ID: <dd6acm$p8c$1@mailhub227.itcs.purdue.edu>
Source record: 16917

I am not sure if the Drake L4-B qualifies as a suitable topic for this newsgroup, but it does use tubes and the power supply could be used as an anchor for a small boat.

Are the Chinese 3-500ZGs a drop-in replacement for the Eimac 3-500Z in the Drake L-4B?

This guy's feedback has been discussd on lots of newsgroups lately.

I agree he has a lot - a TON - of negative feedback, but look at the massive amount of overall feedback generated. Notice his positive feedback number is actually 445996, however eBay only recognizes 1 response from each user. I disagree with this, but that's the way they operate.

When you consider his negatives as a percentage of his true positives, his rating is 96.5%. Still low enough to cause concern, but not as bad as it appears at first glance. That's probably why eBay hasn't dumped him. You can just imagine the fees he generates for them!

Phil,
Not a dumb question at all. Your variac will work just fine.
I'd strongly suggest using an appropriate fuse between
the variac and radio under test.

As stated no effect, excpet in the case where you try to use it with
something that requires more than 12 Amps of current. Then you will get smoke
from the Variac ;) How much smoke depends on:

1. How fast your reflexes are and:
2. How much more current than 12 amps the device requires.

John,

They are direct replacements but they aren't very good. K3FK had a QRO amp with a pair of 'em a few years back and we had to resolder filament pins on one or the other of the bottles several times. We dropped in a set of Eimacs and the problem went away.

I've heard very good things about the Ampex variants with the carbon anodes.

I'm jumping into this thread late, but....

Actually, there is one other condition which requires caution.

Your "Variac" may be capable, depending on the model and options that are wired, of putting out a stepped-up voltage. As I recall, mine can raise the voltage about 15%. It's a useful option, but you must be careful, and don't use it until you have a need you clearly understand.

As to the 12A limit; 12A is a bunch of current, but equipment uses only as much as it needs. You can fairly accurately determine the current your receiver should draw by checking the receiver specs for the Watts. Often this will be on a label on the rear or bottom of the receiver.

If your nominal line voltage (E) is 120V and the posted Watts (P) for the receiver is 350, then the current (I) should be 2.92 Amps (I=P/E).

3347. B&W Sideband generator

Newsgroup: rec.radio.amateur.boatanchors
Date: 2005-08-08 19:06:21 UTC
From: "mccrk@aol.com" <mccrk@aol.com>
Message-ID: <1123527981.941373.142330@f14g2000cwb.googlegroups.com>
Source record: 16936

I have a B&W 51SB-B sideband generator which I use with a 5100-B transmitter. The generator worked fine until recently, when output from the grid circuit disappeared. I discovered a faulty resistor and replaced it, plus I replaced the two 1N34 diodes, which are nearing 50 years old and, I am told, don't age well.

The result: Grid current is up--although it seems to fade on 10 meters--but the output meter indicates far less output than before. Also, the grid current goes below zero while the B-plus is on, but the unit is not being modulated (i.e. I'm ot talking). This is an old problem and I don't know what's causing it. I'm not sure I should worry about the output, since the unit seems to work and the transmitter output appears normal.

Is there anybody out there who is thoroughly familiar with these sideband generators and can answer a few questions?

Thanks in advance for whatever help you can provide.

Steve, W3DEF

Oh, there's far better paper than MSFT. Consider "Fantastic Four
#1", now a major motion picture. That cost 10¢ at one time. How
old were you in 1961?

How many of you had a copy of "X-Men" #1? What happened to it?

According to the current issue of "Overstreet", the comic book price
guide, those two together in near-mint condition are over fifty
thousand dollars.

Depends on the tube, basically. The 3-500Z is a well-implemented design,
but the 6146es still don't meet original spec. And the Chinese 6550
specifically says on the data sheet not to put more than 250V on the plate,
which effectively makes it unusable in anything designed for the 6550.
But on the other hand, the Chinese 211 and 833 tubes seem just fine.

Is this true for all the Chinese tubes? I note there are at least a
couple factories (Liuzhou, Shuguang-Samsung) and at least a few
different brands of the 6550 (ValveArt, Groove Tube). Can they all be
considered as equals?

Tnx,
Bill

Silent Key Auction for Herb Petereit, W0AFY. If you knew Herb, you knew that he was one of the "old timers". One of his first jobs after moving to Omaha, Nebraska, in the 60's was building Galaxy V's at World Radio. He knew his gear inside and out, knew how everything worked, and took a lot of pride in keeping everything running in top shape. For many HAMS in the Omaha area in the 70's and 80's, Herb was the guy to go to when you needed help.

Herb passed away on Veteran's Day, November 11th, 2003, after a severe bout of pneumonia. He was 71 years old.

This auction is for a very nice Icom IC-211 VHF transceiver. This rig covers 144.00 thru 148.000mhz. It has the built in A/C power supply but can also work off DC. Power out is: SSB, 10 watts, CW, 10 watts, FM 1 to 10 watts. Controls include: mic. Gain, RF power, power SW., squelch, AF gain, mode SW., RF gain, VFO, RIT, NB, AGC, rec/transmit, vox, dim switch, tuning, tuning speed button, dial lock, freq. display, rec. indicator, dial lock indicator, trans. ind, discriminator meter, multi-func. meter. The back has jacks for a scope, ext. spkr., dc input, memory sw., acc. jack, key jack.
I plugged in an A/C cord and it powers up with the meters and LED's illuminated. Being that it was my dad's, it's a pretty good bet that it's in good working condition.

http://cgi.ebay.com/ws/eBayISAPI.dll?ViewItem&item=5797089435

Please be sure to check out the auction listings for other items from my dad's shack. Thanks!

As far as I know, all of the 6550 tubes, as well as the fake KT-88 that
is not even remotely a KT-88 design, are made all in one factory.

Then again, I thought the Shuguang plant had been bulldozered a few
years back, too.

But everyone and is brother are importing the things... they show up on
this shores under dozens of different names. I've even seen them sold
as Mullard and Amperex... and now there's some guy selling fake Genelex
paper logos that you can glue on them, and fake Genelex boxes to put
them in.

And none of them even come close to meeting the original 6550 specs.

Hi Steve:

I am not familiar with the B&W unit in particular, although I know about them.

The reverse grid current makes me suspect leaky coupling capacitors. I have repaired a number of Collins 75A4 receivers with leaky mica coupling caps, which then makes the grid voltage positive. The leakage is quite small and it is useful to use a scope or vtvm to measure voltages. Seems to be more common when a solid state rectifier is substituted for the vacuum tube rectifier.

A sudden change is more likely to be capacitor related than resistor.

Good luck, that is a nice piece of history.

Herb passed away on Veteran's Day, November 11th, 2003, after a severe bout of pneumonia. He was 71 years old.

This auction is for a very nice Icom IC-2100H VHF Transceiver. This was my dad's main mobile unit that he used when he was storm spotting. There are minor scratches that are to be expected with a mobile unit, but none on the controls or the screen (the microphone actually looks like it's never been used). It's a very clean unit and as far as I know, in perfect working condition. Power and antenna leads are included.

I can see this being $20,000. Friend of mine had one since 1955; I had the
pleasure of using it on AM phone and CW. He sold his in '97 for around 15
grand to pay wife;s medical bills. It was absolutely pristine and a fine
piece of equipment. Collins collectors, indeed, pay premum prices for
KW-1's.

> Steve, W3DEF..... Steve I have the SSb adapter and 5100 ..When you switch to SSB the 5100 grid current is now read on the grid position of the SSB unit..grid current in the 5100 is of no significance in this mode..when you are in CW or AM the 5100 grid meter will read accurately.. If you go to AM and tune up the 5100 you should see abt 60/65 watts out on watt meter..when in SSb you will probably see abt. 75 peak watts.I have never been able to get full power out using the SSB adapter,I have tried several units,they are all low in output..SSB is nice and crisp but lower than I expected.. Good Luck Harold W4PQw

I've seen it a couple of times during the time that the Eimac tubes were manufactured. I suspect that in all of these instances, the amplifier's cooling system was not quite as it should have been. It is much more likely to happen in an amp which relies upon fan cooling and less likely in an amp using the Eimac Air System sockets and chimneys.

The Chinese tubes that K3FK had problems with were of the Penta brand.

Source record: 16854

Harold:

I've always been able to get 100 watts or so out of the B&W 5100 on AM up through 20 meters. It drops off after that, and on 10 I get perhaps 75 watts. On ssb, though, I've always gotten 100 watts output on peaks. Perhaps the difference is that I am using the 5100-B and the sideband generator designed for it. The 5100 had slightly less input power than the later B, although the sideband generator was the same circuit as the one I have, but used its own power supply. It was designed to be use don any number of 100-watt rigs. The later ssb generator for use with the 5100-B has no power supply, and gets all its power from the transmitter.

Thanks for the info.

Steve

Lets also not forget that we never use a variac with out a volt meter because not everyone's line voltage is the same and we can't just blindly trust the markings on the variac either. The best variacs have voltmeters on them but most don't. A lot of old radios were not designed for 120 volt so there good to have just for testing but one needs to know exactly what voltage is being put out.

And of course, a variac is not the same thing as an isolation transformer.

Ed Price wrote:

> Also depends on how big a fan you have blowing on the Variac.

Maybe - but generally - how variacs react to overload depends on what kind of shape the brush assembly is in--- if its pitted and nasty - (usually because the spring has gotten weak) it's going to generate excessive heat even before it reaches rated current- and once across that- then even a fan won't help. Variacs (variable autotransformers) need care and maintenance like all equipment - and since they're so simple - often taken for granted and ignored - until they protest by letting their smoke out...

best regards...

nice big amp, spare set of tubes. someone else needs this amp, its in my way and I don't intend to fix it... bad Hum when the HV is turned on. not a cap, may be a loose winding in transformer... I bought it from an estate in Springfield, Mo. and was told it was working... I have 250.00 in it, make me an offer... I'm 35 miles south of Branson, Mo. in the Ozarks... pick up only, it weighs 100 lbs. unit looks good and is clean...

3404. Slightly OT: WTB old 50Kv power pole insulators

Newsgroup: rec.radio.amateur.boatanchors
Date: 2005-08-11 15:57:23 UTC
From: William Mutch <wcm1@NOSPAM.cornell.edu>
Message-ID: <MPG.1d653f7073917402989824@newsstand.cit.cornell.edu>
Source record: 16893
Cross-posted to: rec.radio.amateur.boatanchors,rec.antiques.radio+phono

I'm working on a resoration (for display only) of an antique
experimental 50 Kv 3 phase transformer which was handbuilt here in the
School of Electrical Engineering at Cornell sometime between 1890 and
1900. It was used as a classroom demonstrator !! (pre OSHA !) by the
first director of the school. I think this monster classifies as a
boatanchor...not in the sense of a tube era radio (which might hold down
a weekend sailboat)...but has a laminated core which would moor a sub
chaser or even serve as a lunch hook for a corvette or DD. Heavy.
Anyway its original insulators are missing and I need to find five
of them. From the one old original photo we have they appear to have
been about 8" in diameter, 7 or 8 " high, shaped like a common
supermarket variety moonlight mushroom and white or light tan in color.
They mounted to the wood frame of the transformer on threaded wood pegs
similar to those used of telegraph lines along railways. These were
definately larger than the glass telephone/telegraph insulators common
to collectors. The mounting stem is tapered wood, 5" high, threaded at
the top 2", Outside diameter 15/16" at the top of thread, 1 3/16" at the
bottom.
Anyone have a lead about where I could find five of these ??
There is a modest budget above reasonable shipping costs. We have no way
to specify an exact match to the originals but only have to find some
historically appropriate pieces which will fit the mounting stems

I am not familiar with the "midnight Mushroom" but the insulators sound like a common, current use, 25kV pole insulator that come in dark brown or pale grey. Check with your local power utility and take the photo with you.

Might want to have a local glass blower make you some copies if you have a sample or good pix of the originals.
Artists like that work, its cash money, not like waiting for it to come from their art at a fair...

If this is a static display and will not actually be fired up. ;0) The
perhaps the school of art at the university could make some from the
photos in ceramics. That would keep the project in house so to speak and
probably give you the closest possible match short of actuallly finding
the insulators in a dusty old box in the basement of the engineering
building :)

Check out your local scrap metal yard. The one I
go to (searching for treasures) recycles pole pigs,
and you should be able to get several insulators from
the cases. They are mostly interested in the copper.

Steve

3419. Lattice-wound RF choke replacement, 50 years later

Newsgroup: rec.radio.amateur.boatanchors
Date: 2005-08-12 13:30:47 UTC
From: Tim Shoppa <shoppa@trailing-edge.com>
Message-ID: <1123853447.833965.298810@g43g2000cwa.googlegroups.com>
Source record: 16809
Cross-posted to: rec.radio.amateur.homebrew,rec.radio.amateur.boatanchors,sci.electronics.components

I'm fixing up some older ham transmitters. 811 or 6146 finals, etc. in the 50-200 watt class.

Invariably these have sat on the shelf for so long because the RF choke for the final died a horrible death (sometimes charred beyond recognition) in their final use. I myself have fried/burnt several RF chokes and other final components in Heathkits etc. but that was many years ago when I could order exact spare parts. Sometimes a capacitor or two is burnt up too, but these I already have in the junkbox or can buy off-the-shelf.

The chokes that burned up seem to be between 1mH and 2.5mH or so, and were lattice-wound on what seems to be a ceramic form. Maybe it's a ferrite, but I don't think so.

6146/811/sweep tube handbook construction articles from the 50's show similar RF chokes in their circuits and part numbers like "National R-100" and "Ohmite Z-214".

I look in modern catalogs and I see molded (almost certainly ferrite core) RF chokes in the right inductance (low mH) and current (100mA to a few hundred mA) range but they look nothing like the old lattice-wound choke. Are these suitable substitutes for the originals? Something in the back of my head says that ferrite core losses with all that RF across the choke will make the thing burn up at transmitter RF power levels even if I'm below the DC current limit for these parts.

AES lists some pi-wound 1mH and 2.5mH RF chokes (ferrite core) that look more like the original. Better idea for these?

If I wanted to learn to rewind the original chokes (very often they double as ceramic supports for the anti-parasitic RL network and plate caps) are there any web resources that would tell me how to wind my own lattice-wound RF chokes? I've wound my share of simple solenoidal coils in repair/homebrew endeavors, but the slices in these RF chokes seem very ornately wound. I think there's a Lindsay or similar book about coil winding, is that on my "gotta own" list?

Oh well, back to replacing those smoking electrolytics in the power supply, I know how to do that!

Tim.

Wow, this is like Antiques Roadshow taken to the nth power. I mean,
they're pretty and all, but some of the prices attached to those
pictures are enough to buy a small house.

I suspect the OP doesn't want a collector's item, just something that
looks like a common regular insulator.

Yes, it is just the schematic that I seek. Pearce Simpson Newport 120.
After tossing many old marine AM radios away while I was in the business, I
suddenly had a desire for one. This beautiful specimen I have was at a flea
market. I kept going back and looking at it and wondering If I (Cheapskate,
1st Class) should spend $20. The attendant finally said, for gosh sakes,
mister, here, just take it! I don't want to lug it home one more time
anyway!

Nothing wrong with Chinese clothes hangers, Japanese TVs or many European made cars.

All countries export. Protectionism is on the rise; US industry being the first to yell "Dumping" when they lose market share or can't compete! End result is American consumer pays more than necessary every time a 'Protection' or US government subsidy is empowered as a result of the many lobby groups!

Sometimes get impression US government is run by US industry not the voters?

Cultural influences: Been a lot of complaints, in some countries about, for example the heavy import of US films and music. But there are signs that other countries of the world are starting to catch up and also producing more suitable/acceptable product, especially to the younger members of these other cultures.

Some will argue that since movies, are outgoing, i.e. being 'exported from the USA' that's alright?

That growth of US industry, whether it was Bethlehem Steel or Boeing Aircraft is exactly how the US grew prosperous in the late 1800 and 1900s. Immigrants, availability of labor, opportunity (i.e. freedom or lack of restrictions sometimes called American Enterprise etc.) Sikorsky Helicopters for example was founded and led by an migr/refugee from Europe. Einstein was also an immigrant; so also Werner Von Braun of Nazi rocket fame was hired! If you had something to offer come right in past the Statue of Liberty.

Not clear about these current rants; for example Lou Dobbs, on CNN with his "Exporting American Jobs".

Many of the products the USA imports come from countries where it is more expensive to produce; have higher wages, and taxes to pay for more extensive health and social programmes, many of these countries have fewer natural

resources than North America, have harsher climates, are a long distance away and yet compete well for the US consumers dollar and yet are not subsidized within their own countries competing world wide in an international market. But many produce superior/competitive goods!

Working in the Middle East for example my relative had the practical choices of buying either a German or a Japanese vehicle. US vehicles are few and far between! In the same area US truck type vehicles are virtually unseen. Trucks made in Europe or India predominate.

So if a US consumer wants to buy say a SONY Japanese TV (Very expensive country Japan) a BMW or Mercedes (Germany very costly country live and work btw) or a teak dining room set from the Philippines, a cheap tee-shirt from China, a good quality wool garment from Australia or canned Dole fruit from South America, who should say "No".

The international market now includes India and China (each of which have tree times the US population many of them well educated and smart) and other 'emerging nations' and it will get increasingly competitive and demanding both in buying and selling.

Another factor is US protectionism: For example the multi year ongoing complaint by US softwood producers that "Canadian lumber is too cheap" has been lost so many times on appeal through NAFTA (North American Free Trade Agreement) that Canada is now starting to export to China and other countries. The US government having long imposed a hefty tariff on that lumber, at request of the US industry which is estimated to add a couple of thousand dollars to each new US built home! Next thing there'll be a US wood shortage; and prices will rise. Which is fine for the wood industry but expensive for the US consumer.

And Bush wants to extend NAFTA to South America!

The bottom line is that no country can 'protect' itself from outside influences (look at the current price of oil!) or say to it's citizens you cannot buy such and such an item that is otherwise freely available on world markets. In our case that is the purchase of Yaesu, Kenwood, Sony etc.

Is it true that Wal Mart the world's biggest retailer (So they are 'supposed' to be doing something right!) alone, buys more from China than some world countries GDP (Gross Domestic Product)? So if you don't like their plastic 'doodads' don't buy them. Maybe buy wooden ones made in the USA?

That's correct. There is a budget, but it's not large, and since
we're not sure exactly what insulators were originally used we don't
plan to blow the budget on them, but to try to find something
appropriate at a reasonable price.

The only reason that the US consumers can *afford* to buy imported goods is they have traditionally had fairly good paying jobs that stood firmly on the shoulders of US manufacturing. Not anymore! We've gleefully exported all of those jobs...try and find a US made pair of shoes in your local Walmart.

The only way the US can compete with $2/hour factory workers in other countries is to either become much more efficient (we are already near the top in that catagory), or drop salaries to third world rates.... or do without.

You cannot build a real economy without making something. Service jobs (Dr's, lawyers, McDonalds...) simply consume capital from one source, and distribute it to another.

>Tim.

Tim,

The idea behind the multiple section windings on these chokes is the prevention of unwanted resonances.

The choke must present a much higher impedance than the plate impedance over a wide frequency range. A single solenoid that has enough inductance at the low frequency end is going to have a lot of self-capacitance and will wind up (no pun intended) with unwanted resonances at some other frequency(ies) in the operating range. Above any parallel resonance the reactance will go capacitive with disastrous results.

In an attempt to control this, the chokes are effectively broken up into several smaller and dissimilar chokes connected in series.

Here is an example of a solenoid wound choke that uses different winding lengths and diameters to place resonances outside the range of operation:

http://www.qsl.net/n7ws/RF_Choke.jpg

I see no theoretical reason why ferrite loaded chokes cannot be used as long as all of the design caveats are observed.

I have had the filament unsolder to Eimacs in several amps. W6SAI pointed out the problem in both the 3-400 and 3-500's. My old Henry 2K had the problem years ago with a 3-400Z. Last year I had problems with Eimac 3-500Z's in my LK-500NTC.

If the tube socket loses its spring grip the filament does not make good contact and loses its solder. In The Henry, the tube often just popped out of the socket, With the LK500NTC I still don;t know what the problem is but suspect the filament transformer may not be balanced so one tube draws too much current or even the voltage my be say 4V to one tube and 6 violts to the other rather than 5V to both. The tube is solid in the socket!

To fix YOU MUST use silver solder and a torch. No soldering iron or gun will do the job!

Well, sure. I didn't point the site out as a hint you should
use the only two known deep-purple hand-blown 60KV insulators,
I pointed it out becuase it seems to be the nexus for folks who
Know A Lot About Insulators. I doubt those folks think every
insulator ever made is worth huge bux any more than we think
every garden-variey AA5 is worth as much as a Stratosphere.

Sound like a cool project, BTW. I know someone else asked if
it would be possible to get some pictures. I'd be interested in
seeing it, too, when you get a chance.

Hi,

The Ohmite rf chokes you mentioned were characterized
by their design frequency. E.G., the Ohmite Z-50
and Z-144 were intended for 6 and 2 meters. The Collins 30L-1 linear
(4 ea 811A's) used an Ohmite Z-14 for its plate choke.

I have some Ohmite Z-1 chokes which should be good
for a 160m amplifier, although they were designed
for broadcast band use. (Does anyone have the "official"
specifications for these?)

==========
Suitability of any choke for this application can be readily checked (in
circuit)with a grid dipper ,which should NOT indicate resonance within any
of the used bands.

Absolutely. A self-parallel-resonant inductor above its
resonant frequency will appear as a CAPACITOR.

>Here is an example of a solenoid wound choke that uses different

>
>http://www.qsl.net/n7ws/RF_Choke.jpg

Excellent photo quality there, Wes. Also, it amused me to see
so MANY sections on that RFC assembly! :-) I've seen quite a
few and "dipped the plate, peaked the grid" on many an HF
transmitter of olden times using such RF chokes.

>I see no theoretical reason why ferrite loaded chokes cannot be used
>as long as all of the design caveats are observed.

I can only add that the Micrometals *free* toroid calculator
incorporates approximate self-resonant frequencies in their
program's calculations. Excellent program for toroidal inductor
design...can't beat the price! :-) www.micrometals.com

Problem is, if this is a restoration kind of project similar to
old automobile restoration, toroidal forms won't do...just
weren't many in the old transmitters of the 1950s and before.
Anything of the same construction type is going to be an
expensive special-order thing now. :-(

Micrometals manufactures powdered iron, not ferrite, cores. The two materials are quite different. Among the larger manufacturers of ferrites are Fair-Rite, Magnetics, Indiana General, Siemens, and Ferroxcube.

When making an RFC using a core of any magnetic material, you need to insure that the core won't saturate from the flux generated by the DC current. This is done by including flux density in the calculations, and comparing it with the flux density which the material will support before saturating. Powdered iron cores will tolerate a much greater flux density than ferrites without saturating -- but the permeability is much lower, also, which necessitates more turns and therefore higher flux density for a given inductance and DC current. The presence of an air gap in the magnetic path reduces the flux density for a given inductance, so saturation isn't nearly as much of a problem with a solenoidal inductor than with a toroid. However, once again, there's a trade -- the air gap reduces the effective core permeability.

If you don't want to calculate the flux density, you can evaluate an inductor by measuring the inductance or RF impedance while the normal amount of DC current is flowing through it. The current has to come from a source with considerably higher impedance than the inductor's, say from a high voltage source with series resistor, or a transistor connected as a current source. The measurement device is connected through capacitors. Some saturation isn't a problem as long as the impedance remains high enough for the purpose at hand -- as the saturation level increases the impedance will drop.

Low frequency ferrite -- with an air gap -- can be a good choice for an RFC because at HF the impedance is resistive or, at worst, looks like an extremely low Q inductance. This results in an impedance that stays relatively constant for a very wide bandwidth (typically decades), and

is just about completely free of resonance effects. But again, flux density has to be considered whenever it has to pass DC current.

In fact, this isn't quite a "restoration to original build" type
thing, it's more of a "fix some old stuff that's been sitting on the
shelf for years and put it to use" type thing. Most of these units
are in pretty good shape, and I'm guessing that after the RF chokesdied
they were swapped around at hamfests for a few years with each
owner realizing they didn't have that choke and passing it on to the
next guy... eventually ending up with me.

In fact, Pi-w
ound chokes are still listed in the Hammond catalog and
a couple of them are stocked by AES. I ordered a 2.5mH one which ought
to be able to handle the 100mA or so that a single 6146 will need and
I'll grid-dip it and try it out.

I would still like to find a good reference on lattice-wound and
Pi-wound coil winding in a do-it-yourselfer's workshop. I think
I remember seeing a book that shows how to build a little coil
winding machine that'll do some of the ornate pi winding, and now
I kick myself for not buying it at the time.

Even though the choke fires took out some stuff, the ceramic core
seems to be intact in most cases and I think I could rewind something
useful and authentic-looking on them. (OK, I'd use enameled wire and
not that funky real skinny cloth kind!). Again the intention is to
put these rigs back on the air after fixing whatever is necessary.
Having
powered them up, most of them are fine right up to the final stage (OK,
they generally need new electrolytics in the PS) where everything stops
because of plate current. I probably will replace the tubes in
mostcases and I'm guessing that after I get plate current flowing again
and
replacing the miscellaneous capacitors blown up in the final
compartment they'll
need to be reneutralized.

Tim.

Dana, Too bad I'm not just a bit closer! If your HQ-120 is blowing fuses, it may well be that the old wax/paper capacitors are finally giving up. My '120 required that 100% of them had to be replaced. The B+ voltage was being loaded down so much that the fuse would blow. If yours haven't been replaced... its a sure bet they'll need it. Thank the stars the receiver is fused and don't try a bigger one... it'll just make more smoke! de K3HVG

I have a Heathkit SB-201 Linear Amplifier for sale. Unit is in good cosmetic condition. I plugged in the amp and read high voltage on the meter. However, that's the extent of my testing. No way for me to test further. The final amplifier tubes are in place. No dents or dings that I can see. Nice looking unit. Will probably need a good going through before placing on the air. I'll leave any necessary repairs to the buyer. Sold as-is. Excellent deal at $250 plus shipping. Please email if interested.

Thanks.

3450. SSB Voice on S-38D by twisting wires

Newsgroup: rec.radio.amateur.boatanchors

From: Williams <spikewilliams@qx.net>
Message-ID: <sMCdndNFN6c2TWPfRVn-pg@qx.net>
Source record: 16839

I've had this Hallicrafters S-38D for 4 years, and finally I read how to get SSB voice --phone-- on it. Lower sideband.
Not a word about this capability anywhere else I've looked in the interim.
Now, maybe, the same thing can be done with the S-38A B C and E ["E" what ain't got the little white plastic knob on the back].
I MEAN, NOT ONE FORNICATING WORD, ANYWHERE!
Anyway, ya gotta Yahoo search " "S-38D" " and click on the URL that has http://www.thes38guy.com ...31x.html
Then ya click on his S-38 mod... which ain't a mod... just moving the wires... ostensibly like they supposed to be, anyway.
I've had some computer glitches and haven't been able to cut and paste the URL into here.
The strongly whistling BFO also helps ya spot signals.
Now, I did wrap the wires REAL DARN GOOD 2-3 complete turns, which may be overkill, but I ain't complaining.
Love Ya, Baby!

> Love Ya, Baby!

Ya shoulda asked earlier, Jimmy. And puleeze kill the html posting
while you're at it!

Now here's the rest of the story. I notice you mentioned Lower sideband
specifically. If the BFO is tuned properly you should be able to get
both sidebands but since the S-38* is a "small" anchor its best
sensitivity will be in the lower bands which are mostly lower sideband.

If you find yourself unable to tune Upper sideband...say for example,
stations above 10 MHz, the BFO may need tweaking. Since you've been in
there messing around I guess you know where the adjustable BFO coil is.

The quickie method is to find a quiet place on the dial...and adjust the
BFO coil thru its rotation. You should hear a point where the 'rushing
noise' (no not the Russian woodpecker noise) passes thru what would
appear to be a center point. Set it on that magic spot. Done. Then you
can fine-tune USB stations off to one side of Donald Duck and LSB
stations will tune in off to the other side with the front panel Bandspread.

Many guys encounter non-working BFOs in S-38* and although the
Flintstone gimmick coupling scheme is always suspect, often the IF freq
vs BFO freq have drifted so far away from each other that it appears
that the BFO doesn't work.

I'll have my girl send you an invoice Monday Morning for this advice.

-Bill

hi Tim,
yes, a reference to how to do pie-wound chokes would be good - jumble wound would be fine, but its probably like cable lacing - you just want to know how to do it for the sheer satisfaction of it hi hi !

the picture link that Wes posted looks pretty good aesthetically (and evey toher way as well) - how was it done, how as the former made up - looks like plastic, hopefully a follow-up post from The Man? - these things also provide a useful way of getting B+ to the anodes of the tubes......

I too have a "accidental" collection of old valve type amateur HF radios - (too many, in fact) that need to be got on air as a first step - will worry about the "authenticity" of the process later.

3453. New Program. L-match Networks.

Newsgroup: rec.radio.amateur.boatanchors
Date: 2005-08-14 09:23:27 UTC
From: Reg Edwards <g4fgq.regp@ZZZbtinternet.com>
Message-ID: <ddn2iepro1@nwrdmz01.dmz.ncs.ea.ibs-infra.bt.com>
Source record: 16842

Occasionally it may be useful to deduce the value of the terminating impedance of an L-match network when only the values of the coil (uH) and capacitor (pF) and the frequency are known.

Program L_NETWK does exactly that.

The terminating impedance is often the input impedance of the transmission line leading to an antenna when an impedance measuring device is not available. Whereas it is possible to estimate the values of the coil and capacitor settings from a visual examination. The L and C components having been set by using the SWR meter or TLI.

The program also assists with assessing the range of terminating impedances which can be accomodated by a given L-tuner. Without such assistance a considerable strain is placed on an ordinary person's imagination.

Download in a few seconds program L_NETWK from the website below and run immediately. No unzipping inconvenience.

3464. Interfacing L-4B to Ten-Tec Orion

Newsgroup: rec.radio.amateur.boatanchors
Date: 2005-08-14 20:09:32 UTC
From: John N9JG <john@gotwals.xremovey.com>
Message-ID: <ddo8dp$9c7$1@mailhub227.itcs.purdue.edu>
Source record: 16703

The Orion manual warns the user not to directly connect the Orion's external key line to older linear amplifiers made by Collins, Drake and Heathkit, because the voltage on the linear's keyline is too high. Instead, Ten-Tec states, a relay or transistor switch is _required_ between the Orion amp key jack and the amplifier PTT keyline.

Does anyone know of a suitable device or schematic for this interface? Preferably, it would be self-powered.

John, N9JG

No turns depends on dia of form but the size of the form don't matter.
I use forms from fried chokes, 3/8 inch to 1 inch.
With 26 wire and 3/8 dia, expect 3 inches of winding or so then use
analyzer to get about 170uH and check for zeros around 23MHz and a
second around 33MHz. Tweak the 170uH to get the zero at 23MHz in
situ but with the PINET unhooked...

Well, Ed - I don't know what Terry's story was, but I know what mine
was. I bitched and moaned for a while, found another job, and in
retrospect can see that it was in the long run for the best.

It is childish to think that my personal convenience is more important
than the efficient operation of the entire machine. I do realize this
requires advanced level wisdom, wich is sorely lacking worldwide.

Hey Mike - K5VSE
Formerly WB6VSE, senior tech, amateur division
SBE/Linear Systems, Watsonville, CA

What's the story on the SBE-36 ???

Someone has told me it was made by Robyn in Japan but sold under the SBE name.

Also wondering why they used Nixie tubes when some LEDs were available in the early 70's. I think Signal One CX-7 was the other rig that had nixies but switched to LEDS.

Just curious as I just got one.

Seems to work as good as a Collins without the $20k price tag. :^)

No harm intended, but you may, indeed, find that it wouldn't sell--except to
a small, select group of collectors. Twenty grand IS a lot of money.
However, they haven't gone up, either. KW-1's were listing for 20 thou'
back in '96, so it means the price has reached saturation. It doesn't mean
that the price is outrageous or somehow has something to do with Ebay.

I have brought my L-4B linear out of storage, but I have lost the two prong male VOX plug. Does anyone know where one might be located and what type plug it is? I had assumed it was a 2-prong Jones plug with flat blades, but the holes look circular in nature. Could someone give me some guidance on the name and type of plug and where one might be purchased?

Hi. Not sure if this will work, but I'm seeking valve data on LOCTAL tubes only.

Anyone out there have a list of LOCTAL tubes made, along with their data?

My email is:

hobby_electronicsDELETE@ntlworld.com

Of course, please remove"DELETE".

Thanks.

P.S. BTW, if I had to get one, what Amercan valve data book would contain LOCTAL data? I'm in UK and I think LOCTAL tubes are pretty much an American tube.

What's wrong with, say, G-10 glass epoxy rod for winding RF chokes
around?

Is it flammability/gasses made in a choke fire that would make G-10 be
not preferred?

Tim.

Just a few: the Wireless World/Iliffe valve data book (9th ed 1970)
shows B8B (Loctal) in the index at the back with 67 discrete pinouts!

8-)>

If you're desperate, you could always run your finger down the
penultimate column on each page and note the ones that show B8B.

Best,
Chris.

Hi Tim,
got no idea really - over the years I have sort of got used to things bursting into flames occassionally(sp) hi hi , so dont worry about it but just give it a go and see what happens. I also dont leave things running un-attended, so am not the complete lunatic I would seem.

To me, the main criteria is whats on hand - there are not REALLY huge voltages and currents there, so a bit of latitude in the materials selection process seems to me, at any rate, quite reasonable.

No doubt one of the space shuttle designers on this group will promptly debunk my theories.....

And yes, I sometimes DO represent the lunatic fringe of radio - guess I never really grew up. But I have fun.....

This coming Sunday....

+++ Now even more Buyers Parking !!!
Thanks to TKT we have use of their new parking lot
across Albany St from the SWAPFEST !!!

!! ** More Buyers PARKING is available ** for details see
http://web.mit.edu/w1gsl/Public/flyer

*** !!!! In our Traditional GARAGE and the adjacent lot !!!! ****
so come rain or shine or super heat the Flea is on !!!

********* $1 buyers discount with hardcopy of this notice ********

COMPUTERS - ELECTRONICS - HAM RADIO - COMPUTERS - ELECTRONICS - HAM RADIO

FLEA all SUMMER at MIT
Sunday August 21st 2005
9AM-2PM

Come to the city for a great flea - plenty of free parking.

MIT's electronics and ham radio flea will take
place on the third Sunday of each month this summer,
April thru October.

There is tailgate space for over 600 sellers and
free, off-street parking for >2000 cars!

Buyers admission is $5 (you get $1 off if
you're lucky enough to have a copy of our ad)
and sellers spaces are $20 for the first and
$15 for each additional at the gate.

The flea will be held at the corner of Albany and
Main streets in Cambridge; right in the Kendall
Square area from 9AM to 2PM, with sellers set-up
time starting at 7AM.

SEASON PASS + Advance Seller Discount

A sellers discount season pass is available which
offers a 30% discount. By prepaying you get a
discount and earlier admission. See the registration form.

*** Attention Sellers ***
Prepaid vendors.. Season Pass or monthly,

will be admitted FIRST.
Separate lines will form prior to gate opening
for prepaid and nonprepaid vendors

!! RAIN or SHINE !! Have no fear of rain, a covered
well illuminated tailgate area is available for all
sellers (6'8" clearance).

Talk-in: 145.23- (PL 88.5) W1BOS/R and
W1XM/R-449.725/444.725 (PL 114.8/2A).

Why are there all these big dollar hoaxes coming out of Africa??
I mean, of all places...why Africa? I get those silly emails about
someone's father, the general who died and left a lot of money, and they
need my help for something or other, blah blah blah.
What's up with that??

If you'll check the headers very few of them actually come from Africa.
On the other hand there are probably night classes in Lagos Nigeria
that tell users how to forge headers to make it trace back to somewhere
like Romania ;)
In my opinion, 99% of this is done by plain old everyday pranksters and
hoaxers. The same ones who do the PayPal spoofs.

If you think they are pranksters, you would be wrong! The scheme is an interesting one, and it is definitely making alot of money for some n'ere-do-wells. Here's how it works:

Nigerian #1 sends a paypal/ebay/visa/.../younameit phishing scam out of an internet cafe in nigeria. He spams the entire US with it. Of the people that receive it, a few choice idiots give their account information to the phishing site.

Now Nigerian #1 has enough information to get into a bunch of accounts in the US, but cannot, because US banks will not honor wire transfer and EFT requests from Nigeria. So, what to do? Nigerian #1 sells the accounts to Nigerian #2 who works a different angle.

Nigerian #2 sends out his Prince UbangedadongandIopendadoor letters asking for help transferring some mislayed millions of dollars out of a government account. He spams the entire US with these letters, and a few choice idiots will respond. To those who respond, he tells of a need to bribe some local government official, who will only take US $100 bills... what to do? Well, he offers up an account number, and says that if you will withdraw the money from that account, in $100 US bills, and send them to him FedEx in Nigeria, he will make the bribes, and the millions will be transferred into your account. For your effort, he gladly lets you keep 30% of what was in the account.

Now, this account was one that he bought from Nigerian #1. Some poor slob's paypal/visa/WAMU account. So you, being a sceptical sort, give the account information to your bank, and they wire for the money, and it appears in your bank account. WOW! you think, this works, here is some real money! I'm

going to be a MILLIONAIRE!!! [insert happy dance here] So, you take the 30% and stuff it in your pocket, and FedEx the rest to Prince UbangedadongandIopendadoor. The good prince gets the money, thanks you very much, and is glad to inform you that the bribe is going to work, but now he needs your account number, and SSN, etc. in order to have the money wired to you. You, having tasted real money, gladly comply.

Someone is knocking on the door, it must be Prince UbangedadongandIopendadoor!

Oh, darn! It's someone from the FBI, wanting to ask you questions about a bank account you emptied out.

Where's that money that Prince UbangedadongandIopendadoor said would be wired, it would come in real handy for posting bail...

Meanwhile, your account information gets sold to yet another Nigerian...

Get the picture?

-Chuck

Oh yeah? I know how the scam is *supposed* to work. Can you name one victim of this particular scam? (Well, there's always one) And what does it have to do with Africa which was the original question? There's a website out there where some guy has dogged a few of the "Nigerians" and it makes for fun reading. I've dogged a few of them too. None of them have been in Africa.

Sure, there are phishers out there. They catch more people logging into phony PayPal "re-register your account" than they do with the Prince Ngdbulasaski scams. And they snag more than a few with people simply going to the fake login pages and winding up with keystroke trojans.

Chuck, I think you give them (the so-called Nigerian letters) more credit than they are due in the world of internet scamming.

A local woman was arrested about a month ago for getting involved in
one of the "Nigerian" schemes. She was greedy enough to fall for the BS
and now she is out a lot of money, and in jail. I didn't get her name
because I was so busy laughing, and deleting a dozen similar e-mails.

She cashed a check the bad guys sent her. It was the money to pay
the "Bribes", but the bank notified the FBI about the check because it
was drawn on a bank they were investigating for other cases. Of course,
it later bounced and that was about the time she was arrested. You
should have heard her on TV yammering on that she had only tried to help
the other people, and hadn't done anything wrong. I'll bet her IQ meter
didn't hit 70 most days.

Hi
I just picked up a (stoner) Dymek DA9 active antenna. The tuning cap has somehow been bypassed and it does nothing to affect the station. I was told that this was bypassed intentionally so as to be a broadband antenna. I'd like to resore ti to original and use the tuning cap as a preselector.

Does anyone have a print / schematic on this unit ?

Thanks!

3515. Eico 720 transmits with awful note

Newsgroup: rec.radio.amateur.boatanchors
Date: 2005-08-21 00:39:51 UTC
From: shoppa@trailing-edge.com
Message-ID: <1124584791.402907.286150@o13g2000cwo.googlegroups.com>
Source record: 16754

OK, I fixed up the RF choke in my Eico 720, cleaned up a few things,
put a "new" 6146 in (taking out the 6146B that someone else had put
in),
etc.

The oscillator/multiplier seems to be working fine. I put in a 40M
crystal, can peak up grid drive just fine. Set it to 20M, and get
14 MHz out of the driver. Switch to 21 MHz, the driver works as a
tripler.
So I think all the tuned circuits there are working fine.

Plug in a 75W light bulb, can load it up just fine. Dip in plate
current
exactly matches peak in power out. That's great.

But while I'm tuning up into the dummy load, the note as monitored on
a nearby receiver sounds awful. Yeah, there's a carrier there, but I
hear
obvious 60Hz hum and what I think is 60Hz FM. Some chirp, but not too
awful.

I've already replaced the electrolytics in the power supply (40uF 450V
units replaced with new 47uF 450V units). Do all Eico 720's sound this
bad? Or is it something else? Maybe the crystal can't take the power
in the oscillator (the 6CL6 oscillator really is putting out nearly 70V
P-P on 40M)? Something wrong with the clamper? Hum on screen
voltages?

Next thing I'm gonna try is putting a known clean crystal oscillator
into
the Eico 720 and see how it sounds.

All the voltages in my 720 seem to be maybe 10 to 20 percent high. Is
this better electrolytics, higher AC line voltage, or is it indicative
of something else?

Tim (KA0BTD).

Sounds like either the rectifier has failed, or the filter caps.
Try it REAL quick with the rectifier tube pulled, on hand on
the line cord.

Pete

I finally got my Tuska radio via the mail only to discover the two rheostat knobs had been replaced with 1940s communication receiver types. Does anyone have these in their junk box? They have a long metal pointer and the circular knobs have a deep recess in them. Pics available on request and have been posted on A..B.P.R.

Thanks

I did try that... The slo blo fuse blew after a second. This should
have removed power from the filter caps. Does this indicate that the
problem lies elsewhere than the Power supply? Thanks.

Funny you should mention this. I'm building a homebrew set and noticed
the two knobs I selected from the junquebox are Tuska knobs which I
figured might be in demand. Unfortunately mine are tuning knobs, 0-100.
2-3/4" diameter skirt. If you (or anybody else) have a need for these
let me know.

I have a different receiver that continually blew fuses. I eventually determined that it was a bad power transformer, probably a shorted winding, since it blows fuses with the secondary completely disconnected. I hope this is not your problem. Good luck.

A shorted tranny is the most likely cause. But it could also be a wiring failure, a bad tube socket, or even a shorted heater bypass capacitor.

If you have a good low range AC clamp on ampmeter, you can check to see where the current is going on the secondary leads. Or, you could always carefully unsolder the secondary windings and see if the fuse stops blowing.

One thing, a 100W lightbulb in series makes a good test indicator for these kinds of problems. It will prevent the blowing of 1A fuses, and will light brightly in short circuit conditions. It is a bit easier on whatever is taking the short circuit current too.

3529. Question re: Collins 75A-3 image problem

Newsgroup: rec.radio.amateur.boatanchors
Date: 2005-08-21 19:24:01 UTC
From: David Austerman <daveaust@pol.net>
Message-ID: <bfba78992096bca01dab3770b2ad3186.32924@mygate.mailgate.org>
Source record: 16768

I have a 75a-3 that I haven't really ever used until recently. It works but has very serious images at about 3.3 and 3.6 a few hundred kc wide. Also same thing up on 20Meter band in wide spots across the band. Sounds like AM bcb bleeding through but haven't been able to match the distorted signal to anything on my am radio. When away from the noisey areas on the dial, the real signals sound fine although the rx is fairly deaf unless I REALLY peak the antenna closely with my mfj-949 tuner(longwire & hy-gain vertical). I dont know if that means anything or not but my other rx's(r-390,nc-300,HROs...) front ends seem to be more broadbanded and can literally pick up signals with a piece of wire. Also, I don't get this same interference on my other rx's using same antenna, etc, so I'm concentrating on the receiver. I recently aligned it via the orig manual and checked all tubes. PTO tracking isn't too far off. Most caps were changed by prev owner. Everything else with the receiver looks fine otherwise. I'm not sure where the "leak" is coming in via mixers or what. I'm not an expert on rx repair so I thought I'd ask some experts on the list to find out if this kind of problem usually boils down to just a few things. Any help or suggestions will be GREATLY appreciated. Thanks/73, dave austerman, N5WNM, Oklahoma

John

Harbach Electronics makes an interface module that might work with
your setup. Drop them a line and check. I think it sells for around 23
dollars. You could homebrew one, but you'd have to know the keying
voltage and current drawn by the relay in the amplifier.

If it blows fuses with the rectifier tube removed, this is almost
certainly the problem.

But, the good news is that when this happens, the shorted turn is
almost always on the (very fine wire) HV secondary, which is the
top winding in the bundle and the easiest thing to rewind.

I'd suggest removing all of the secondary windings at this point.
It could be a wiring problem--such as a pilot lamp socket
shorting out, or even arcing in the rectifier tube socket.
You have nothing to lose. The dim bulb test on a transformer
will the secondaries unloaded will reveal a shorted winding
quickly.

If it is the transformer, I suspect the radio should have some
burnt odor to it. They usually take several minutes of cooking
to fail to that degree.

Next step is dumpstering/parting the receiver, or finding a
donor. Those R-100s are problematic with the PCB
style bandswitches...

Thank you for the information, but another person had suggested the
Ameritron ARB-704 Interface Buffer, for $50. I have installed this device
and it seems to work fine.

I am also glad to know about Harbach Electronics.

Hello All,

I was wondering if anyone had any old vacuum-tube based Tektronix equipment (5xx series scopes, plug-in's, etc) that they wanted to get rid of. I am located in the Vancouver, BC area and can come and pick-up anything in a 50 mile radius. Does not matter if the equipment is not working.

Thanks for your time,

Regards,

Chris

Most always the HV winding is under the filament windings. HV windings are
not the easiest to wind.

Do you have the top and bottom covers on the radio? The Collins rigs
will show a substantial improvement in image rejection when all of the covers
are in place, and properly screwed down.

You can often get a substantial improvement in performance in Collins rigs
by exercising the screws and nuts that hold the intercompartment shields,
and tube sockets. These parts get a little bit of corrosion over the years,
and no longer work as good shields.

-Chuck

Aha! That might be it. Better (more logical) choice on caps nowadays
would be the ac-rated X-Y disc caps. Available at Mouser, Justradios, etc.

Yes, Gary has a good point. I didn't expect they placed the caps
behind the fuses, most manufacturers had them right at the line
cord entry!

My answer also- maske sure the problem is not in the RX before tearing into
the 720.

Might I suggest if you only find one or two suitable insulators that
you consider making your own from molds?

Try researching Alumilite (www.alumilite.com) as one source for
mold making kits.

I'm looking for the inductance and current rating of the HQ-180A power supply choke so I can find a suitable replacement. Mine burnt to a crisp although it still shows continuity. It reads about 250 ohms and on the DMM's Lx function it says 7.0 Hy. Thanks for any help.

The filter choke you measured sounds like what the original would be. These things are not critical at all. Find one about 7 or more henrys and 250 to 300 ohms, and if it is the right size, you are in luck.

Your choke may be fine. Find out the reason it did that. Too much current was obviously drawn. The fuse should have blown before the choke burning up.

Check the rectifier and filter cap. Then measure the current draw of the radio. It would be about 150 to 200 ma.

73, Colin K7FM

Chris;
You don't say if you want to buy them or if you are looking for a "gimme".
I have a model 555 scope with plug-ins, power supply and orginal cart that I
don't use and never will but I don't want to just give it away. I don't
know if it works or not but it is complete including the million or so tubes
in it. You can take a look at it on my web site at:

www.home.earthlink.net/~dmign/index.htm

there is a menu bar on the left side of the page. Click on the TEST EQUIP
link and it is near the bottom of the page. Also I am in the South-eastern
part of Ohio, USA so a little more than 50 miles from you.
E-mail me at: dmign at earthlink dot net if you want any more
information.

You should certainly visit the SERF sales at UBC. Lots of stuff moves through there, some of it of the vintage you're interested in.

You'll almost certainly find some stuff you didn't know that you needed, but you suddenly do need, as well as a bigger vehicle to haul it all in!

Tim.

Thanks, gb and Colin for the tips. My guess at about 200 mA is ok, I guess. The choke is pretty charred... all the varnish was boiled out and dried on the chassis. The outside paper is brittle now. The filter caps seem ok. I checked them last night and they have between 35 and 50 microamps leakage at full charge and working voltage. Today I will wire the choke back in and use a Variac to check for abnormal current draw. I'm not discounting a shorted turn or two inside the choke although the dc resistance seems normal. I did just buy a 10H, 300mA choke on Ebay with about the same form factor.

The power supply filter is the classic pi with 40uf input and 80uf (!) output. That capacitance combined with 7 Hy sure doesn't seem anywhere near 120Hz for filtering. But what do I know? Thanks again.

I have a Transmitter which is rack mounted in a cabinet and capable of over 150 watts but will dead key transmit at 120 watts (continuous). The transmit is variable from 5 watts to 120 watts. I also have a dual Receiver rack mounted in a cabinet. Both have power supplies and are very heavy duty pieces of equipment. Wouldn't take much to convert to a 440 repeater or use as is for volunteer fire department or small city.
Units must be picked up in Dallas.Comes complete with manuals for both.
Will sell (make offer) or trade for good Ham HF rig, or ????.

Pictures of manual & rig:
http://www.grodgers.com/dfwforsale/transmitter440.jpg
http://www.grodgers.com/dfwforsale/receiver440.jpg

Units are skid mounted and virtually unused. Appereantly this was a backup unit.

Contact me at ke5bfa@comcast.net or reply to this email.

I had a couple of doghouse blue Tek scopes I gave away to a guy, who wound up parting them out and building some very crude tube audio stuff he charged a lot of money for to gullible idiots in St. Louis. That town appears to be a haven for audio con men.

The old Tek scopes are either too much work to keep going, or have mostly been used so heavily they are no longer usable. There are no more parts for DESIRABLE Tek scopes! Tek has not made an actual oscilloscope in nearly ten years and the last ones (the TAS series) were crude and nearly unusable.

Large quantities of certain parts do exist-because either those are the parts that don't go bad or they are for stuff you don't want anyway.

Actually, old Tek scopes have some great parts that lend themselves to happy employment in some really nice tube designs . . . .

They are probably all bad by now. Take your old handles to a shoe repair shop,
and see if they will sew up a new pair out of blue shoe leather. It's an easy job.

Depends on the sentimental value. A rewound transformer would
buy TWO nice examples of the R-100 Stateside. It should be
easy to find a replacement from a junker, even from another
brand, that would work though.

Pete

3562. AM operation of KWM?

I saw an auction for a Sampson Modulator which looks to be a way to apply full plate modulated audio to the output section of a Collins transmitter or transceiver. it has the "11 pin octal" socket which is used, aside from relays, only two places I know of, the Collins S-Line ham equipment and Hammond organ speaker cabs.

First, is that what this is?

Second, since the KWM-2 has no AM position, how is the BFO disabled for AM rx operation? The audio would be unpleasant even if intelligible if AM were listened to in a SSB mode.

My guess is that this was actually intended for illicit 11 meter use but would be usable on any band.

Yikes! I could buy a brand new standard transformer from Hammond for
$40 -$50. No, it wouldn't be original, but would it matter? Are R-100s
really down to the $20 range?

!!!!!!!!!!!

Further to my previous message....

What I usually do in the case of a blown power transformer is as follows.

If an exact replacement transformer is not available or affordable, I buy a good electrical replacement from Hammond or whomever. It is never a good mechanical match, as we all know. Rather than hacking the chassis to death, I make up an adapter plate. I take a piece of flat steel (old computer cases are exactly the right thickness, and they're free) and drill two sets of holes in it, one to match the original transformer, one to match the new transformer. I then mount the adapter plate either above or below the chassis using 8-32 hardware and spacers of the appropriate length. Next I mount the transformer to the adapter and wire it up. This permits me to use the "wrong" transformer, but does no damage to the collector value in case the "right" transformer comes along; I just remove the adapter plate.

Before you dumpster the R-100, send it to me. I'll give you the price of a new transformer for it! The R-100, if I remember correctly, has only two windings, 600VCT and 6.3 filament. Replacing the transformer as I describe

is an easy afternoon project! Radio Daze and AES both list suitable
replacement transformers.

Do a websearch, and you'll find that it's a 25 to 40MHz amplifier.

I have no idea whether it was a legit amplifier or not, but they always
use to sell that sort of amplifier as for the business band adjacent
to the CB band. Not being in the US, I never looked at the US rules
to know if they were legit for that purpose or not.

Sonar was a big name in two-way radios.

The only reason a bandswitch is needed is if the amplifier or rig
covers more than one band. That sort of thing is common in amateur
radio, but not in other services. Note even within amateur radio,
people would build single band amplifiers (sometimes low power, sometimes
full kilowatt), and a good example of commercially built amplifiers are
all those amplfiers for the VHF and UHF bands.

Just so happens, I have a good tranny from a R-100A, ready to ship, and it
doesn't blow fuses.

Yeas ago a friend of mine worked at Executone in Long Island City.
They had pile of these with matching single low band FM units, both used tubes.
The mobile version of those amps put out around 40 watts with good 12 volt heavy wiring (2 sweep tubes with 450 volt inverter)

Actually, receiving am with a bfo is fine. You are just copying 1/2 of the sideband. The Drake 1A came out when am was still popular and no am detector or switch. Called exhalted carrier or something like that.

I think there were a number of rigs that use the 11 pin plug. The Johnson products, including the Ranger and Pacemaker and Valiant, if I recall correctly. But, do not shoot me, please, if I am wrong. My wife points out my faults often.

Indeed! ;-)
The power transformers from the older tubed beasts are great for
projects,if you can find any info on them,or else sit with the DMM and a
pencil for a while untill you've got it..(a variac is helpful too!)
I scrapped one that was beyond help,along with a HP that I couldn't
figure out,tried/tested everything under the sun,finally gave up.
Tons of good tubes,sockets,etc. in there too!

I am very aware of when "A" bandswitch is used. I'm also familiar with
Sonar's equipment "to a point". I hadn't seen this particular item before
and seeing no bandswitch, I knew it had to be for a particular range of
frequencies, just wasn't sure which. Thanks for reply.

If it's just the HV winding, you can do the rewinding yourself. It won't
cost much, and it'll be fun.

<snip>
I think that's the model that one of mine came
from(tranny#120-120)..I've collected 3-4 big Tek trannies over the last
few years.

I'm sorta looking for another Tek tranny for my projects,marked 120-296
(from Tek 564's),if anyone has a spare. I'm thinking if I can find
another,the pair will make nice power trannies for a couple of PP EL34
monoblocks. ;-)

3582. Power Connector for KW2000B

Newsgroup: rec.radio.amateur.boatanchors

Does anyone know where I can purchase a power connector for a KW Electronics KW-2000B? I need the female plug. It is an odd 15 pin connector, with one row of 7 pins and one row of 8. (rectangular). I understand it was made by Cinch, but it is not similar to the "Jones" plug. The pins are round, not blade-shaped.

Thanks

I have a Tektronix CRT and Shield:

The CRT part# is 154-0531-00
The shield part# is 337-1021-01
and the power transformer:
The transformer part# is 120-0575-00.

I believe they are from a 561 rack mount scope I scrapped for the
high voltage supply to fix a portable scope. I also have the power
transformer from the same scope.

I've got a Power Transformer out of an old Tek Scope - 545 I think or maybe
an earlier model. The model numbers are all starting to run together in the
ole noggin (hey I'm getting old!) and it's been like 5 years since I had
this thing. Anyway, it was one of the big dinosaurs. The scope worked fine
but I had no room for it, so I stripped it. May have some other parts

floating around too. The transformer does have a part number I can supply. If anyone is interested, let me know. "I" don't need it. Not sure what shipping would be, this sucker is heavy. I also have 2 manuals for 2 separate models of the 422 scope - both in fairly decent shape.

If you dig that deep into the tranny, mite as well rewind the primary as
well.

Mine has 120-140 on it. As I said, it was removed from a working unit. All I did was cut most of the wires coming from the scope areas - off the "taps" of the transformers. Otherwise it is in good shape.

3594. R-390 DC & Audio

Newsgroup: rec.radio.amateur.boatanchors
Date: 2005-08-23 23:30:50 UTC
From: quickhatch <esejkora@comcast.net>
Message-ID: <nNGdnY1lK-xKLJbeRVn-pw@comcast.com>
Source record: 16683

I have an R-390(non-A) that recently developed a problem. When I first turn it on, both audio level and RF level (carrier meter) are weak. DC voltage at the "regulated" test point (J601) on the side of the AF subchassis is only about 65 to 80 VDC, with less than 0.005 VAC ripple. After "warming up" for another 5 to 8 minutes, both audio and carrier levels abruptly jump to "full strength", and regulated DC is up around its rated 180 VDC. However, audio is distorted with heavy hum, and there's about 4.5 VAC at the regulated DC test point. Both the high voltage electrolytic (C101) and regulated DC filter (C103) capacitors check out within spec. Any other likely culprits to start checking out?

Thanks!
Ken, WB0OCV

Hehe I had one and thought about trying to get it back into shape for audio work. Then I saw the sticker on the plugin with a calibration date due for 1965. $200-300 on ebay will get you something decent. In fact if you ebayed all the ceramic terminal strips in a tek scope you could probably pay for a newer one.

11 pin Octal socket was used on a LOT of equipment in the 50/60s.

Your right tho....sounds like some sort of CB junk to me.

I used Collins S-lines and KWM2s for years. Never ever heard of a outboard
"AM Modulator". Why anyone would want to do that is beyond me.

The last generation of Tek tube scopes, the 544, 546 and 547 had a solid state vertical section and actually hold up pretty well, but the CRTs are 35 years old! The older stuff though is really tough to bring back from the grave. Especially the ones with the distributed vertical amps!

Well, I may have overstated that. But, I see nice ones going in the
50 to 60 dollar range, and ones that would make good parts units
in the 20 dollar range on ePay.

But, most likely it was the linebypass caps as others noted, and
not the transformer.

Pete

I see this quite often.. Lots of people use these comm receivers for BC listning..Quite often lightning will zapp the BC band RF input transformer.. If that is the case, it can usually be rewound and repaired. You might test it by connecting an antenna through a 200 pf or so capacitor between ant and RF amp grid pin..If it receives ok then you need to look at input circuit.. GL W4PQW

The distributed amplifiers, fortunately, are very conservatively rated, and built with reliable componants. The only likely failure is one of the tubes. Finding the bad tube is quite easy, because it will leave a glitch on the leading couple hundred of nanoseconds of a high risetime squarewave.

I have a 585A, and a 513D, both using distributed vertical amplifiers, and the only problems I have had have been elsewhere. Usually very easy stuff. The 585A is an extremely easy to use and a very reliable scope. I have been using them since the late 1970s with very few problems. I have found the 545A and 545B to be similarily reliable, as long as you use a good CA plugin, and stay away from the 53/54 series. The 547 is a terrific scope.

I keep the 585A around as my "winter scope". It is nice to have around during the winter time. The rest of the year I use a 475, 2465, or 7D20/7633.

Looking at my 1963 ARRL Radio Amateur's Handbook, outboard modulators
were the "in" thing back then.

I have a 546 with a 1A1 plugin; bought ca 1980 surplus at Dayton, still works.
Only problem is the on-off switch, which has problems with the current draw.

I've just replaced it with a calibrated 465, however, so if there's someone
in the Bloomington, IN area who wants a scope (with cart) get in touch.

I also have an older Ballantine RMS voltmeter which is now not needed (since
I now have a newer HP unit). It worked the last time I turned it on, about
15 years ago.

Hi,

Collins sold the accessory model 55G-1 low frequency tuner
in order for the 55S-1 receiver to be used below 2mc.

The 55G-1 uses a single FET, and works on two bands,
200 to 600kc and 600kc to 2mc.
It came in a cabinet which matches
the style of the 55S-1. A small speaker is included.
The 55G-1 is pretty rare, and may cost almost as much
as the receiver, depending on condition.

If your receiver is totally dead below 2 mc
(i.e., you can't even hear the 100 kc calibrator),
V10A or V16A may be bad. (Both are 6EA8 tube sections).

If the previous owner used the 51S-1 receiver
with a 55G-1 tuner, he would have cut the internal
link between J13 and J14 (RCA connectors on the back panel
of the 51S-1). Try plugging in a patch cord
between J13 and J14 and see if that helps.

73,
Ed Knobloch

By 1963, AM was called "Ancient Mary" in ham circles, which is why
Collins didn't provide for it. 11 meters was and is a different story.
It is of course illegal to operate a S-Line or any other
non-type-certified CB transmitter on that band, which makes the
practice all the more fun for the dedicated "Chicken Bandit".

Obviously, if you wanted AM on an SSB rig, you'd have little choice
but to add an external plate modulator (unless you unbalanced the balanced
modulator(s) and bypassed the crystal filter if it was a filter rig).

But yes, external modulators seemed common at that time, and maybe
for a longer period. When the US Novice license came along, it made
a certain amount of sense to have the modulator external, so the rig
was initially cheaper and you didn't need a modulator until you upgraded
your license.

An external modulator was also a way of dividing the weight. Get the
heavy modulation transformer out of the main rig.

But from reading of material from that period, nobody seemed to be
plate modulating an SSB rig.

Plate modulation is not a way of producing SSB. The SSB signal must be amplified linearly, and generated at low level. FM, I believe, not only can but benefits from being run through a Class C stage. The idea with plate modulation was that the RF path was CW all the way to the finals, and the audio directly modulated the final amp. The modulated signal then had to be handled only in a linear fashion, but that was at the rx end-the last stage in the tx being, obviously, the final.

The gizmo we are looking at seems to be a simple mod xfmr placed in the plate supply to the 6146s in the tx. An audio amp such as a stereo or guitar amp hooks to it and the mic goes to a preamp. In fact my guess is back then a guitar amp was exactly what was most used.

Well, you can't use it to plate modulate a kwm2 or collins S line
either. The finals in those transmitters can not be run in class C.
There is not enough grid drive available in the CW mode to do it. Also
the plate tank components are not hefty enough for the added plate
voltage plate modulation supplies. Neither is their power supply heavy
enough for AM operation.

Well actually, you could do phasing at high levels. And depending on
the high level balanced modulator, it just might be plate modulation.

You put two high level balanced modulators at the output of what
amounts to a CW transmitter. The balanced modulators knock out the carrier.
Then you use the phasing method to knock out the unwanted sideband.

No commercial rig did it this way. I'm not so sure any homebrew rig
did it. But it is within the realm of possibility. Certainly, there
were a fair number of articles for high level balanced modulators so
you could take an existing rig and output DSBsc. It was far easier
to add such a stage, or modify the output stage of an existing transmitter
to make it a balanced modulator, than to put in a low level balanced
modulator and then linearize the rest of the transmitter.

Hi,

CQ magazine, May '65 page 75, gave a simple method
of transmitting a.m. with a KWM-2.
They said if you unbalance the pot
in the KWM-2 "carrier balance" circuit
(on the right front side, on top of the chassis),
but leave the trimmer capacitor alone, you can get about
90mA of plate current due to the carrier, about 15W out
with the rig in SSB position.
Keep the mic level down so the plate current barely flickers on peaks,
and you will be transmitting a.m. with one sideband.
Return the pot to its original position for SSB use.
Chuck Scheuers said he tried it and that it works.

QST had a better method, reinserting carrier
after the mechanical filter, by adding it to the PTO output
using a variable pot for carrier level control
in place of the headphone jack on the front of the KWM-2.
See June '63 QST page 48. (A correction appeared,
that turret connection E40A should read E20A).
The relay connection information in the article applies to the older,
non-plug-in relays (Winged emblem KWM-2).
Relay K4 shorts out the carrier injection during receive.
With this method, you should run 120mA carrier plate current,
and will get about 25W carrier out.

And Swan 350's had the carrier balance (null) pot right on the front panel, and they claimed that allowed you 125W dc input AM on all bands.

Unfortunately, the carrier is injected before the SSB filter, and since the filter's rejection skirt is positioned well over the top of the carrier(better SSB carrier rejection, you see), you lose most of your carrier power before you even start.

There was a certain amount of interest in running early SSB rigs in AM mode, but fortunately that faded rapidly.

3643. Schematic Tektronics Spectrum analyser Pentrix (pre-L30)

Newsgroup: rec.radio.amateur.boatanchors
Date: 2005-08-27 20:35:48 UTC
From: Mat Nieuwenhoven <mnieuw@dontincludethis.zap.a2000.nl>
Message-ID: <zavrhjqbagvapyhqrguvfmncnay.ilwv7o0.pminews@news.text.chello.nl>
Source record: 16632
Cross-posted to: rec.radio.amateur.boatanchors,sci.electronics.equipment,rec.radio.amateur.boatanchors

Hi,

Summary: I need schematic pages 3 and later for an old Tek L30 spectrum analyser plugin.

For my old but servicable Tek 547 I acquired a Tektronix/Pentrix/Spectropulse spectrum analyser plug-in. This 1 - 10.4 GHz unit appears to give way to much vertical deflection signal to the scope, the scope itselfs works fine with a 1A4 plugin and is thus probably OK. Although I have the manual, it appears there are some schematic sheets missing: I only have sheets 1 and 2, which don't describe all the circuits, so there must be at least one more sheet. The manual says up-front it is for type L20-L30 . This forerunner of the L30 has still a continously variable dispersion knob, rather than a calibrated switch, and has the frequency display in the upper left. On BAMA, I only find the manual for the later L30, which is electronically a very different unit.

Who has the missing schematic pages for me, and who knows what might be wrong with the unit?

Thanks, Mat Nieuwenhoven

Hi,

If no luck here, I suggest you join the Tektronix group
at groups.yahoo.com

That group is an amazing storehouse of info for the older
Tek equipment.

Heathkit, by Daystrom, Model HA-10 "Warrior" Kilowatt Linear Amplifier, which covers the 10, 15, 20, 40, & 80 bands. It is in excellent cosmetic condition with exception of a few scratches in the paint on one side. We purchased it from an estate and it appears to have been used very little and is very clean. It powers up and has correct plate voltage, however there is a bad hum when the plate voltage is turned on.. it comes with the solid state 866 replacements +_ spare 866 tubes it also has spare 811's and an spare oil filled cap that I purchased to repair the hum. I have not worked on it and due to my health I don't intend to.$250.00 pick-up only. It weighs over 100 lbs (bring help) I'm in the Branson, Mo. Area..

I've updated my web site and added some new homebrew content.

http://www.qsl.net/n2cqr/

I've also included info on a new PODCAST program on homebrewing that Mike, KL7R, and I have put together. It is called SolderSmoke and I think it will be of interest to members of these groups. Mike (in Juneau) and I (in London) regularly discuss our homebrew projects. We've turned the QSOs into a kind of radio program. You can listen to it via your computer, or you can subscribe and have episodes automatically downloaded to your MP-3 player. Then you can listen to homebrew-oriented QSOs while on your way to work, or wherever.

I hope you like it. Feedback welcome. Here is the URL for the website: http://www.qsl.net/n2cqr/

Silent Key Auction for Herb Petereit, W0AFY. If you knew Herb, you knew that he was one of the "old timers". One of his first jobs after moving to Omaha, Nebraska, in the 60's was building Galaxy V's at World Radio. He knew his gear inside and out, knew how everything worked, and took a lot of pride in keeping everything running in top shape. For many HAMS in the Omaha area in the 70's and 80's, Herb was the guy to go to when you needed help.

Herb passed away on Veteran's Day, November 11th, 2003, after a severe bout of pneumonia. He was 71 years old.

This auction is for a very nice Icom IC-211 VHF transceiver. This rig covers 144.00 thru 148.000mhz. It has the built in A/C power supply but can also work off DC. Power out is: SSB, 10 watts, CW, 10 watts, FM 1 to 10 watts. Controls include: mic. Gain, RF power, power SW., squelch, AF gain, mode SW., RF gain, VFO, RIT, NB, AGC, rec/transmit, vox, dim switch, tuning, tuning speed button, dial lock, freq. display, rec. indicator, dial lock indicator, trans. ind, discriminator meter, multi-func. meter. The back has jacks for a scope, ext. spkr., dc input, memory sw., acc. jack, key jack.

Being that I am not an amateur radio operator, I really don't have any good way to test this. However, I did plug in an A/C power cord and it powers up with the meters and frequency LED's illuminated. A/C power cord is included.

Find out what the actual B+ (and other) voltage SHOULD be and build
a supply to supply it. What the original source frequency was is no
issue as to what the original supply PUT INTO THE CIRCUIT. The
400hz supplies only cared about the INPUT voltage and frequency.

Hi,

I wonder if I could tap into some collective insight here while waiting
for a manual and schem, (thanx Joe), here's where I'm at with the radio...

1. The machine comes on, I get a display, all leds for frequency bands
are on, Iguess that only FM, default, or the last band selected should
be on) half of them dimmer than the other half. Can repeatedly turn
radio off and on if no other function/button is selected. If I push a
button of two, I can neither turn the machine off, nor select any other
bands, have to unplug...

2. When the machine sits a bit, off (power plug attached) It comes on,
and now I am even able to tune a bit w/ the encoder, and even key in a
frequency, and it changes, and plays a bit, then dies...Letting it sit a
couple of minutes, it can be switched back on, and tunes and plays a bit
more, starts to growl...and then the sound stops, its stuck and I turn
it off..

While I'm not even a mediocre tech, it sounds like a cap is initially
empty, charges, then starts to leak...IIRC, a power supply cap, or drop
in ps voltage might be might explain the growl.....
Maybe the same in the 5v supply? Or should I freeze spray the thing???

The radio uses, AFAIS, among others,

M5840 cpu
MM5481 led driver?
MM5368 oscillator
TDA1571 mixer
TDA5700 radio chip

Anyway, would really appreciate some help....

regards,

nikos

Power isn't getting to where it should be. The supply rails somewhere
are too low.

Get out the meter and start checking the power supply voltages. After
checking them AT the supply, start checking them in other places because
you may well have a cap that is intermittently shorted and pulling down
the supply rails. Also feel around with your fingers and see if you
can find anything hot.

One trick I like for finding bad decoupling capacitors is to bridge a
large bench supply across the supply rails. If a cap is partially shorted,
the high current suddenly available from the bench supply will usually
make it fail catastrophically. Note that it DOES sometimes take out
board traces so be careful.

Channel 13 - WLOS TV in Asheville, NC is reporting that a number of gas stations in WNC are closing down due to an outage at the supplier's terminal in Spartanburg, SC. The terminal outage is said to last 3 days or so.

Just a heads up - if you're going to Shelby this weekend, might wanna keep 'er topped off as you travel through the affected areas. Just got this clip from http://www.wlos.com./

Mountain Fuel Shortage
Hurricane Katrina has knocked out power to many areas in the Gulf States and that's affecting the two major suppliers of fuel in the Southeast.

That means delays in fuel deliveries to stations here in Western North Carolina. Wednesday morning we found that some gas stations only had premium. And at least one station, is selling gas for more than $3 dollars a gallon. People are urged to cut back on unnecessary trips and to conserve gasoline as much as possible. If the gas problem continues for several days, cities, towns and counties may ask police and firefighters to stay overnight to be sure they can get to work.

In South Georgia, gas deliveries to some stations have been suspended until
further notice. In North Georgia stations are running out in smaller towns,
and shipments aren't expec6ted before another 3 weeks. At least one small
town Sherriff's department has pulled all patrol cars off the street and is
only sending out .
for emergencies.

Ga Governor's office has lifted restrictions on truck drivers carrying gas
supplies to allow them to drive more hours than they were previously limited
to.

I was going to drive up there. It is about a 300 mile drive for me. I changed my mind because I'm not sure if I will be able to get gas. From what I hear, they are closing gas stations for the weekend around here. I guess I don't need anymore radio suff that bad.

FS a CDE Ham IV Rotor and Control Box. It has not been used in several years and will need lubing and the cable terminal board on the Rotor will need replacing. Some of the screws on the terminal board have rusted into to place. The Control Box is in nice shape and Rotor has only been used a couple of years before being stored. It should clean up and make a very nice, strong unit.A copy of the manual is included. Digital pictures are available. Price is $225 plus shipping from 79602. Thanks, Charlie Hugg, K5MBX

If you come thru Gaffney, SC on I-85 there was fuel at $2.65 (as of 2 PM
8/31) on exit 92 (Pilot and Petro). I notice a lot of spaces that had not
been taken at Shelby (I was over there today putting up my tent). There are
quite a few campers there as always, and more will prolly arrive tomorrow.
I hope it will be a good ''fest inspite of all the fuel troubles.

Agreed, I hope it'll be business as usual. With Dayton spinning down, it's good to see Shelby still standing strong.

For those coming up from I-85 south, I'd say top it off in the Greenville/Spartanburg/Gaffney area.

For those coming in from I-85 north, better catch some no later than Gastonia or Belmont just before you turn off of I-85 onto Hwy 74.

For either situation there's convenience stores and/or truck stops at many exits.

Today, there are a "fair" amount of 'festers on site with the camper section near 74 Business full. The guy next to me is from New York, so some aren't afraid to travel. The Exxon out there on 74 and 74 Business had their gas at $3.39 per gallon! Petros in Gastonia 10 cent cheaper.

IMHO, this is nothing but a lousy attempt to take advantage of one situation and "claim" their huge price increases are valid; it is a GOUGE that I hope BACKFIRES on the oil companies. It's time for consumers to simply NOT buy for a few days and see what happens. Of course, I suspect the gas price will "mysteriously" begin to drop after the Labor Day holiday disguised as refineries being "repaired" (how concidental that they get repaired right after Labor Day because they can "hide" under the disaster.) I hope they CHOKE on their ill-gotten profits! :(Me, except for attending the hamfes)t, I am sitting at home until the SOB's rot; I can WALK to the grocery store if I have to!

Well -- I agree that the price bump in the last few days is
suspicious. On the other hand, consider the following:

o Forty percent of the nations refinery capacity is at an absolute
standstil.

o The main pipeline feeding the entire eastern half of the US for
what refined products ARE available in storage terminals is running
at less than 30% capacity.

o The Gulf Coast has the landing terminals for 50% of all crude oil
consumed by the US.

o Every agency on the ground says it will be *weeks* before things
are back to normal.

Everything we learned in high-school economics tells us: Prices are
going to rise. I fear that it is going to get worse before it gets
better. If it makes you feel any better, buy energy stock.

> It's time for consumers to simply NOT buy for a few days and see
> what happens.

Well, the trick is not to move your purchase decision - a deferred
purchase is still a purchase. The trick is to actually lower
consumption -- something that, for good or for bad, my countrymen have
not shown a great interest in for decades.

> Of course, I suspect the gas price will "mysteriously" begin to drop
> after the Labor Day holiday disguised as refineries being "repaired"
> (how concidental that they get repaired right after Labor Day
> because they can "hide" under the disaster.)

I cannot believe someone wrote that - Do you honestly suspect the oil
industry conspired to make a hurricane happen near a busy travelling
weekend? Sometimes an amazing coincidence is just a coincidence.

Reminds me "And the second gangster says to the third, `but how were
you able to arrange a flood?' ... " [1]

> Me, except for attending the hamfes)t, I am sitting at home until
> the SOB's rot; I can WALK to the grocery store if I have to!

A great idea all the time -- good for one's health, good for the
environment. Now if we just had urban planning that put the grocery
stores a teeny bit closer to where we lived ...

Of course, I live down in XE land, so we have abundant cheap gasoline
(US $2.15 at current exchange rates) and I have three grocery stores
within a five minute walk of my house.

Good for you. The closest grocery to my house isa couple miles away.
It is down a busy highway with no place to walk, and I have to use a
cane so walking to the grocery is out of the question. Because of this
I try to arrange to stop at the grocery when I have to leave the house
for another reason.

As I always say, "We all have our bears to cross!" ;-)

I'd be happy to, but I am not sure what you want. I have a box full of FT243 xtals, but with the exception of a few that were reworked by companies like JAN, or texas xtals, they all have the original military bakelite, or metal covers.

Please explain.

-Chuck

Hi Chuck,
I'm looking for the labels like those from Jan, Texas Crystals,
Peterson, etc. I guess that would be the "reworked" ones.

You should be able to play them on a flatbed scanner and get
excellent images. I have a couple FT-243, but I think they are all mil
surplus. I'll try to get to them and see what i have. I know i have a
few N.O.S Bliley crystals, but I don't know what cases they are without
opening the crumbling paper boxes. Would you like scans of the boxes,
too?

Just need some "ham market" labels to stick on my xtals.

Tnx,
Bill

It's an Icom 211, of course it doesn't work.

I gave one of these to a friend, who also had one. He needed two to
keep one running. I always said that it was a tribute to his
character that I gave him an Icom 211 and we remained friends.

I thought a lot of them were Dymo-labelled. Or for that matter,
with a piece of paper someone typed the frequency on, and then taped
to the crystal with a clear tape.

I realize that's likely from the end user, but that sort of thing
sure seemed more common than the thing being looked for, which I
can only vaguely picture in my mind.

Indeed, there are not so drastic measures consumers can take. Of course,
when the price of a commodity rises beyond the price the public as a whole
is willing to pay, then the demand falls with an often matching fall in the
price. If we just stop in our harried schedule to think, "Wait a sec. Is
THIS trip really necessary?" Or, "Can I combine this with an other errand
tomorrow". If we made a conscious effort and goal of saving ONE gallon a
week in our own driving, how much would that impact the demand for fuel?
One gallon--even two--for every vehicle in the USA saved. How about a more
ambitious goal? One gallon per DAY=5 gals per workweek X how many drivers on
the road at a time = what? Of COURSE, there are trips and business that must
be made/done. OTH, how many times do you just hop in the car without a
second thought to run down to the Radio Shack and pass the SAME store the
next day going to the grocery store? How about slowing down to 55-60
instead of 70 per?
How many Escalades do we see each day with ONE person when we could carpool
to work (some DO carpool but there are untold numbers that "prefer" to have
their car to themselves Heck, I press in the clutch on my little truck and

coast down long hills often maintaining 55 while the engine is idling at 600 RPM; at steady state, the engine is at 1700 @ 55, 2100 @ 70. If I don't just HAVE to go, I will just stay at home, piddle in my shop and watch TV. We ALL have to do a little to prevent the profiteers from taking advantage of our spoiled habits of yore. I KNEW "them" Surburbans" would come back to bite us eventually!! :)

If anyone is using diesel, the local Giant food store here in Laurel, Maryland is selling their brand name vegetable oil and Crisco oil in bottles of a little over two quarts (as of September 2) on sale. It works out to be about $3.10 per gallon.

(Today, diesel fuel here was priced at +/- $3.65 per gallon.)

A friend of mine is using Crisco in his diesel powered Dodge Ram 2500 pickup truck.

He says he gets 25 to 27+ mpg on the highway (about 10% less than diesel fuel), vegetable oil provides better lubrication for the fuel injectors than diesel fuel and it doesn't stink of diesel. He says the diesel engine exhaust smells like McDonald's french fries.

Do a search on SVO (straight vegetable oil). It is a good match for most diesels, but it usually won't start the engine, and at room temperature is borderline too thick to safely pass through the injectors. The solution to these problems is to start the engine on diesel, and use the engine coolant to preheat the SVO. When the engine is up to temperature, switch to SVO. When you are a couple of miles from the end of your trip, switch back to diesel (to clear the filters, pumps and lines of SVO)

Also, if your friend doesn't want to have to fill his truck bed with empty VO bottles, he can buy the stuff in 55 gallon plastic barrels for a much reduced price.

-Chuck

OBTW, using SVO in an on-the-road vehicle is illegal both federally, and in most states, as you aren't paying the required per gallon road taxes. The road taxes amount to about $1 per gallon of the price of fuel. It is also illegal to run a hybrid using a battery charger, for the same reason... non commercial use is unlikely to be

caught in the near term, however. As SVO becomes more popular, I am sure that the local constabulary will find ample time to pull over any vehicle that smells like a fryer. The fines for running untaxed motor fuel on the road are very steep.

It's acidic enough that it will eventually corrode the fuel injectors
if he does this for too long without adding some buffering or cutting it
with diesel. But that should be fine to get us through the current
shortage.

Likewise my local paint store is selling VM&P naptha for around $2/gal.
A gasoline engine won't run on it alone terribly well, but you can cut
gasoline with it without any harm. (Admittedly I say this as a guy
with a car that predates catalytic converters).

Hmm... what are alcohol prices slike?

3714. Shelby HamFest report

Newsgroup: rec.radio.amateur.boatanchors
Date: 2005-09-04 15:38:41 UTC
From: Ron in Radio Heaven <kc4yoy@spam.carolina.rr.com>
Message-ID: <5yESe.53082$ou5.327436@twister.southeast.rr.com>
Source record: 16453

Shelby was down this year, but really not as bad as I expected.
There were a lot of empty spaces in the "meadow", just the group
that I've been going with the last few years usually gets
about 10 spaces. This year we didn't go until Saturday morning
and then just parked in the back lot where the "overflow" normally
parks.
There was a lot of BA stuff there. Ron Beaver had several nice
vintage sets, AK bathtub and other stuff, plus a nice looking
National NC-100X, "I think".
I sold a few items including a Viking Invader 2000 "finally",that I've been
carting around for a while. It's funny the way it works, at least 25 guys
looked at it this AM with no bites, finally someone took it. After I marked
it sold I could have sold it at least 6 times over, one guy kept
coming back wanting to catch the new owner and try and talk him
out of it...
One of the regulars at Charlotte stopped buy to show me a box
of AK parts he had bought wanting to know if they were worth
anything, it was all the parts for a Radiodyne model 10, without
the board...

I didn't really go with the idea of buying anything except a ticket
to get in and lunch at Bridges, but as we were getting out of my
friends truck a couple of friends that had gotten there early
told me they had snagged me 2 pieces of Clough-Brengle
gear for the princely sum of $5 each... I was really tickled when
I saw them, they're 2 models I've never seen before, styling wise
I would put them in the 50's, later than anything else in the collection.
They are models 420 & 340, a matching pair of signal generator
and VTVM. A little dirty but they'll clean up nice.
Here's a link to the C-B web page with the latest additions,
http://cloughbrengle.homestead.com/CB420_340.html
These 2 pieces bring the Clough-Brengle collection up to 21 items.
"Someone stop me, PLEASE!!!"

Even though it was down in size, it was a very enjoyable
day, easy, not a lot of work to make happen, and
we had a GREAT Bridges BBQ lunch to boot.

73, Ron

3724. LED lamp replacement for old Type 47 bayonet lamp?

Newsgroup: rec.radio.amateur.boatanchors
Date: 2005-09-05 17:22:54 UTC
From: malomarski <omar27@bellsouth.net>
Message-ID: <78%Se.15210$ZL4.4825@bignews4.bellsouth.net>
Source record: 16463

Need advice,

I'm fixing up an old Hallicrafters Tube radio and I look to replace the original type 47 bayonet lamp with a long lasting LED lamp. Specs for a type 47 lamp are as follows:

Miniature Bayonet (BA9)
Circuit volts 6-9v
Rating volts 6.3v
Rating Amp 0.15a
Life 3,000
MCSD .52

I've found this link:

http://www.sunbriteleds.com/product.asp?id=50

Where can I actually buy some of these is small quantities?

I am going to use the LED lamp for a dial faceplate and don't want extremely bright; as a matter of fact, I'm looking for a dim Red glow...

Regards,

malo

>Where can I actually buy some of these is small quantities?

As I recall, Harris/Allied Broadcast Supply sells the LED replacement
lamps.

You can also make your own with a high intensity LED, a resistor,
and the base from an old #47 lamp. Heat the lamp with a propane
torch and both the cement and the solder will come loose.

>I am going to use the LED lamp for a dial faceplate and don't want
>extremely bright; as a matter of fact, I'm looking for a dim Red glow...

So use an incandescent lamp with the next higher voltage rating and
be done with it. A 12V lamp in place of a 6V one will be dim, and
last forever.

IF the old Hallicrafters is an S-38, some substitution caution is in order. The pilot light on this (transformerless) model is wired in parallel with one half of the rectifier tube's filament. If the current drawn by the substitute lamp is too low, the heater (filament) voltage across ALL the tubes will be a wee bit higher. Maybe not a good thing for tube longevity.

You can check out the ARRL data base http://www.arrl.org/hamfests.html
if it is available to everyone. I don't think you have to have member
access.
BUT remember that some of the hamfests listed maybe as small as just 20
or 30 folks selling personal gear. If you find one your interested in I
suggest
you contact the club or view the links posted. Then again ask on the
newsy group about particular hamfests.

Cheers 73 K4TWO Gary
FWIW nothing compares to size for Dayton.... or cost

That was Hallicrafters best receiver from 1959 to 1962. It cost
$399.50 new. If it's really perfect, I'd ask for more than $350.

Source record: 16474

Although the SX-101A has a product detector and is the latest version, it does not cover 160 meters. I think the SX-101 Mark IIIA is more desirable.

Not sure what the price is in Europe, but I think an SX-101A would have to be in almost new condition to be worth $350. You said perfect condition and that may carry the day.

The SX-101 series was dated when it comes to stability and frequency readout on 10 and 15 meters. I had hum modulation on mine (in the 60's) and worked a lot of 10 meters. Also, when the electric heater came on in my shack, the receiver drifted. I installed a separate regulated dc for the oscillator filament and it solved the problems. Left it on all the time.

But, the readout was still not very good. I got a Drake 2B, which was small and did not match all of my big transmitters, but it worked like a champ.

Today, I am recouperating from Shelby. Fun but tiring as I get older. I can TELL! I used to walk around Shelby all day and never think about it. I bought some small parts, a good Jerry can (go well with my M38 Jeep restoration), and sold some screwdriver tuner modules I call the "Cricket". I got a hankering for fish so, being a local, I ducked in at Kings Mtn on the way home to Love's Fish Box for some flounder and shrimp. mmmmMMMmmmmm!! Mighty tasty! :)

Why can't you believe it? The states and feds want their road taxes even more than they want a solution to the fossil fuel problem.

Diesel for off the road tractors, and earth movers is untaxed, and is dyed red to make it obvious if a vehicle has ever used the stuff. (It stains the tank red, and the filters. Truckers get checked for this problem at weigh stations. On this I have first hand experience, as I run farm tractors, and earth moving equipment.

Here is a cite on that:

I believe that another bulb number has a significantly longer life than
3,000 hours

The #1891 bulb is another bayonet bulb, but it is rated at 14 volts & 0.24
amps

The #1847 is the long life lamp made to replace the #47. It is the
same base, glass, voltage, and current rating as the #47 and a drop in
replacement. If you want it dimmer or slightly colored, just dye the
glass.

I have a CDE Ham IV Rotator for sale. It is complete with the rotator, control unit, and copy of the manual.The control box is the Black one. This Ham IV is going to need some work. The terminal strip on the rotator will need replacing and the bearings will need replacing also. They are rusted.
This one has been setting for several years. It was working at the time it was taken down. I plugged the control unit in and nothing blew, but the dial light is out.
Price is $125 shipped within the lower 48. Thanks, Charlie Hugg, K5MBX

I always thought that the price was not what the seller wanted but what the buyer was willing to pay. I have bought SX-101A's in near mint condition for $200.00 and also bought an HT-41 from the same guy for $100.00. I have seen SX-101A's go for over $400.00 but again, its what the buyer is willing to pay, ...$8000.00 for an SX-88.....rest my case.

A large regional hamfest is the farfest this weekend. It's also
called the Gaithersburg hamfest.

Speaking of Gaithersburg, if you google for "R-9xx Collins", you'll
get a page that discusses the fabled R-390A that had a factory built
LED digital display in place of the Veeder-Root mechanical counter.

About 30 years ago I saw one of these for sale at Gaithersburg. It
wasn't a homebrew job, the vendor had the manual for it, I recall
that he fanned it and showed folks the circuit diagrams. That's
diagrams, plural.

So you Collins types, a piece of trivia, the "R-9xx" is real. I was
"this close" to it. I wonder where it is today. I bet that an
R-9xx would make an SX-88 or KW-1 look cheap.

an aside, at Berryville a few weeks ago, a fellow had both an
HF-380 and a beater KWM-2. This thing had a binding PTO, was
missing tubes, and the cabinet that looked like it had been hammered
by elves. After mulling it over, I'm interested in the M-2, if
anyone knows the seller, a 3 from Pennsylvania, I'd like to dicker
with him.

de ah6gi/4 email is my call without the /4 at attglobal.net

One of the ways I make a living is designing prototype equipment for
the US Army. I have in the past modified items that were in the usual
military supply stream to add features that were desired by my customer.

The unit you saw could very well be a modification that was done by some
nameless vendor, like myself. Collins, or any of the other R390 manufacturers
likely had nothing to do with it.

I know about using heating oil being illegal. But sure enough, I googled this subject and various state DOT's are trying to get Bio-Diesel categorized for taxation. Still they are not talking about going after solar power, but I am sure that is coming next. By the way, there is a new "initiative" called "open roads", which is everything but open roads. They are trying to put RFID transponders in every car and extract tolls from everywhere you drive.

Lysco Transmaster 600S Transmitter.....$350 plus shipping

I will ship overseas

These do not show up very often and the model with the modulator is even more difficult to find. This is a 160-10 meter AM and CW transmitter that was made from 1951-1953. This is a 7 tube transmitter that uses an 807 for the final. Input power is 35 watts. The transmitter has a built-in VFO and can also be crystal controlled.

I used this transmitter with an NC-173 to work CW replaced it with a Ranger I about 5 years ago. I have not used it since and feel it is time for someone else to enjoy it.

The unit is in in very nice shape cosmetically and put outs around 20 watts on CW. I never ran it on AM so I do not know the status of the modulator. The unit has no dents or dings. The off switch has a key type switch which may or may not be original. Includes a photocopy of the manual.

Texas Crystals, Crystek, Jan, and others often reworked WWII
military surplus FT-243 crystals to customer specs. They either
replaced the original front plate with a new one--with their
company named embossed, or they simply used a stick on
label to cover the original faceplate marketings. The bakelite
housings still have the tell tale military channel numbers
embossed on them, however--a dead giveaway regarding
their original.. I post my examples on the binaries, and email
cc to Bill.

Hi,

>There is no "Trio" in the index.

But there is a listing for Kenwood-Trio! The 9R59DS is best
downloaded from :-

http://bama.edebris.com/manuals/

with a right-mouse-click and a menu selection of "Save target
as"...

However Harold, I can send you a copy but you will need the
'djvu' browser plug-in from LizardTech to view or print it. The
manual is about 500kb in length and the LizardTech viewer, several
MB.

Cheers - Joe (G3LLV)

Yes. Or not. Who knows?

Did you check out the R-390 website? They speculate as to the
existance of the R-9xx, a fabled variant of the R-390A that came
with an LED digital readout.

I'm verifying that such a beast exists. I . saw . it.

There is an R-9xx, an R-390 variation with an LED display in place
of the Veeder-Root counter.

How did it come about? Who built it? Donno.

I can say that it did *not* look home brew, nor did it appear to be
an engineering prototype in the sense of a "proof of concept".

It had a metal bezel that was well finished and the vendor had a
thick technical manual for it. He fanned the pages and showed the
schematic diagrams.

I didn't say that Collins made it. I said that it is documented on a site dedicated to the R-390 and you can find it by searching for "Collins" and "R-390" or go to http://R-390A.NET

Obviously there were not hundreds of these things made. It is also unlikely that there was only ONE, a one-off built in a lab.

I'm *guessing* that there were several, perhaps as many as a few dozen built, probably for NSA, but that is *guessing*. If the customer was NSA, that would explain why few have "escaped" to the wild.

I saw it at the Gaithersburg Hamfest in the mid-1970's. I only saw one so that is all I can testify to.

There are other legendary receivers, some may be fables such as the Signal/One CR-1500 which was pictured in ads but has not been seen since.

Others, such as the Central Electronics 100R receiver designed by Joe Batchelor, exist as production prototype models. This is documented in the ARRL book on boatanchors.

Yes, I checked out the site. They said that there were rumours that
a R9xxx, with a LED display existed. No pictures, though. Not real
satisfying.

I know that I've seen one too. I seem to recall an EAA tag on it.

>

Everything I mod looks a professional as the original manufacturer.
That is part of the job. It is surprisingly easy to do. I now have
a full machine shop at my disposal, but in the past, I have done
professional looking instruments using hand tools. I have engraved
panels, and other foolish things, to make a good looking product.

>
> It had a metal bezel that was well finished and the vendor had a

That's easy stuff too. If it was a modification of an existing unit,
most of the original manual would apply. Pen a few words about the
modification, and make some schematics using Orcad, and you have a
professional looking manual. Even the etched aluminum ID tags
are easily made.

>

On this I disagree. I think the one I saw was likely one of maybe
10 units. It was very much like jobs I have done in the past.

>

Surplus is surplus. Most everything the government buys ends up there
sooner or later in some form. NSA surplusses lots of stuff. Even
interesting things. Usually their gear has had the name plates and
serial numbers removed. (causes interesting problems here in the
peoples republic of MD where it is illegal to possess anything that
has had its serial number altered, or removed.)

>
> I saw it at the Gaithersburg Hamfest in the mid-1970's. I only saw

As I have said, I have seen it too. Probably at the same G'burg fest
as you saw it in... I am a MD boy. I know I could do one just as well
as they did... if someone were willing to pay my freight.

Are you also a fan of SCTV? I noticed your handle there, comes from
that episode with John Candy and Harold Ramis. But I thought that
Candy played the Beaver, and Ramis was Whitey! Joe Flaherty played
Ward and Catherine O'Hara played June, with Eugene Levy as Wally.
Great stuff!

>An Hallicrafters SX-101A in perfect conditions with original manual. How much is it worth?
I would tend to say 350$. Is that right?

You've already received a number of answers, but I'll add one more.

"Paid" prices vary widely as does the actual equipment condition vs
the stated condition. Perfect isn't really perfect, but falls a
couple of notches down from Museum quality and like new.
Beautiful jobs of restoration some times go for quite a bit less than
a bit worn, but stock rig. Other times they are just what the
purchaser was looking for.

Some of the old rigs still work well if they were kept in use, but
it's rare to find something of the 101A, MK II, or MK-III that doesn't
need to have a number of the capacitors replaced.

The 101 series is popular, but not a highly sought after item.
All in all, "I think" the price for a later model will run *typically*
in the $300 to $350 range while the A will be some what less. Still,
the market is fickle as are buyers and those prices may run from half
that to around $400. I don't remember seeing any 101s of any suffix
going for more than that.

So, strictly as a personal opinion I'd say $350 for a 101A is a tad
high, but there is nothing wrong in trying for it.

3785. Tube Socket Source (for Nuvistors, etc.)

Newsgroup: rec.radio.amateur.boatanchors
Date: 2005-09-09 21:02:08 UTC
From: Edward Knobloch <alias@nowhere.net>
Message-ID: <kLmUe.680$FT6.298@trndny02>
Source record: 16524

Hi, Gang

I've recntly bought some "New Old Stock" tube sockets from
www.electronicsurplus.com
in Cleveland. Here is my report:

I was pleased with the Cinch Nuvistor sockets for $.79 each, P/N 5NS.
They are chassis mount, with what appears to be polyethylene insulation.
Their site says they have 924 in stock.

I was also pleased with the Cinch phenolic 7 pin miniature sockets
with shield bases for $.45 P/N PT-172 (They called them "National",
but they weren't really sockets made by National).

Only moderately pleased with the Cinch ceramic 7 pin miniature sockets,
P/N S0101C (due to tarnishing of the shield bases), for $1.39.
The ceramic itself was in good condition.

I bought some Amphenol sockets, "7 pin w/o center hole",
P/N 6-199 suitable for type 1625 tubes, for $2.50.
The sockets are perfect, but I think I paid too much for phenolic sockets.

I also bought some Amphenol 9 pin "octal type" phenolic sockets,
P/N 9-211 for $1 each. I thought they would be the type
that I could remove the mounting flange from, (useful
for making 9 pin plugs), but the flange
looks permanent. Oh well, good for the junk box, anyway.

73,
Ed Knobloch

3786. FS: Dow-Key and other Antenna Relay Switches, various voltages

FOR SALE: Antenna Switch/ Transmit/Receive Switch
I have several of these that are surplus to my needs. All are
tested working and clean.

DOW KEY :

Part number: 77- 220232 7307
Operating Voltage: 28 VDC
Connectors: BNC-Female connectors.
Comments: Apparently never used (no solder traces on electromagnet
terminals)
Price: $20.00

Part number: 84-BSN
Operating Voltage: 48 VDC
Connectors: N-Female
Price: $20.00

60-222542
220 Volt DC
Connectors: Type N
Price: $30.00

Other:

Advance Electric & Relay
Operating Voltage: 120 VAC
Connectors: Type N
Price: $20.00

Manufacturer: Amphenol
Part number: 17-10242-3
Operating Voltage: 26 VDC
Connectors: N-Female
Comments: New in factory-sealed bag.
Price: $15.00

Manufacturer: Danbury Knudson for Motorola
Part number: 80C4298
Operating Voltage: 6 VDC
Connectors: 1 solder 2 BNC-Female
Comments: New in factory-sealed bag.
Price: $15.00

Manufacturer: Sperry Products, Danbury Knudson
Part number: R-142S CHB005AO

Operating Voltage: 12VDC,
Connectors: SO-239/BNC-Male, Solder tabs.
Price: $20.00

Plus postage.

If interested please reply by e-mail.

>From the makers of the GPR-90 receiver

The STR-5 is a fixed frequency receiver, 19" wide and a couple of inches high. It is fixed frequency which can be changed by plugging in another tuning drawer assembly into a drawer. The new assembly has a crystal oven, and slides into a slot, and then makes contact.
This is very very rare. I do not have the power cord which uses the usual Milspec type connector. I have not tested it, so sold as-is, but appears complete.
I'm selling one receiver with one tuning drawer. I believe this is either (1) Canadian Mil surplus, or (2) from the old NORAD Cheyenne Mountain facility.

Here's the spec sheet:
http://www.geocities.com/vintagetmc/str5-1.html

BTW, that's the super TMC website that has almost the entire TMC history

Getting better all the time! When it was just one or two cars doing it, the chances were nil. But now there are websites dedicated to running SVO, or biodiesel. The legislature in MD, for one, had already addressed the issue, and will be taxing biodiesel in all forms.

Considering that the fine is in the thousands of dollars, it might be important to you if you decide to run SVO, or off road diesel.

Which of the three are Dynamic Mutual Conductance tube testers?

The Heath, and the Eico are emission testers. I know nothing about
the Accurate Inst. unit.

Emission testers are basically only good for telling if the cathode
is still active.

If you really want to test tubes, you have to have a dynamic mutual
conductance tester. There were plenty of examples available from
Hickok.

Many people believe that a tube tester needs to be a transconductance type to be accurate. I have numerous examples of both.

My experiences through hundreds of tests are that the emission tester is accurate in almost all cases. As a matter of fact, I usually grab whichever tester is handy. If a tube is bad, either tester will usually tell you. Emission testers may actually be better in some situations - such as determining life left in the tube.

I can recall only two tests in hundreds where the transconductance tester led me to a problem hidden by the emission tester. In one case, a Drake transceiver had a tube that had developed cathode interface and had about a 1 megohm internal leakage, which had developed because of a circuit designed by Drake, which had a very high impedance grid circuit that recommended by tube designers. Although I had substituted another tube, it also had cathode interface. The transconductance tester allowed me to do some detective work to find the problem. A third tube solved the problem.

In the 30's, many people built their own tube tester. I have done that.

I may get a lot of flack for my opinion, but I have my flack shield on and I can only report what I experience.

Colin K7FM

Poppycock! Transconductance testers combine the functionality of an emissions
tester with a simple test for low frequency AC gain.

Further, transconductance testers have a sensitive test for gassy tubes.
Something that an emissions tester cannot do (except in extreme cases).

Your experience just shows that old tubes are rather reliable.
>
> I can recall only two tests in hundreds where the transconductance tester

The condition known as "cathode interface" comes about because the interface
between the metal cathode substrate, and the highly em missive oxide cathode
layer, becomes degraded. The interface develops a higher DC resistance than
it is supposed to have. The problem is somewhat vexing because the capacitance
of the cathode interface remains as high as when the tube was new. The most
noticeable characteristic of "cathode interface" is that the tube has reduced
DC gain, and normal HF AC gain. If you put a square wave through a DC coupled
tube that has "cathode interface" the the top and bottom horizontal lines of
the square wave will droop towards zero. If you compensate the tube circuit
so that no droop occurs, there will be a pronounced spike at the leading and
trailing edge of the squarewave's rise and fall time. Cathode interface was
rarely a problem before the advent of high performance vacuum tube oscilloscopes.

What you discovered was a gassy tube. When gas enters a vacuum tube, the gas
causes a current path from the cathode to the grid. This makes the grid go
more positive than normal. In a circuit that has high grid impedance, the
tube will significantly change its bias point. A fairly important thing in
grid leak biased tubes (that are often found in receivers).

Although I had substituted another tube, it also had
> cathode interface. The transconductance tester allowed me to do some

> detective work to find the problem. A third tube solved the problem.
>

>
> Colin K7FM

If you are going to spend the money and waste the space on a tube tester, you ought to get one that will actually do a good job of testing tubes. Today that is even more important than it was 40 years ago... tubes have become obscenely expensive, and most tubes you will be exposed to have long since passed their expected useful lifetimes. Conditions like gas are quite common, and should be tested.

-Chuck

Thanks in advance, Todd

3806. Advice on SX-101A

Newsgroup: rec.radio.amateur.boatanchors
Date: 2005-09-12 15:54:08 UTC
From: Antonio Vernucci <vernucci@tin.it>
Message-ID: <AwhVe.52916$4g5.3453058@news4.tin.it>
Source record: 16395

I have recently got a very good single-owner Hallicrafters SX-101A, mechanically and electrically intact. The radio is very sensititive on all bands and appears to still be well calibrated, despite it has not been used for more than 30 years.

A problem I noticed, especially on 14 MHz, is the presence of several strong AM broadcast (BC) signals across the band. Interesting to note that the receiver preselector control yields no change at all in the BC signal strength, whilst it yields a very clear peak in the 14-MHz background noise.

The first idea which came to my mind was poor image reception. With an IF frequency of 1,650 kHz, the image should be plus/minus 3,300 kHz from the actual 14-MHz receive frequency (i.e. in the 10.7 or 17.3 MHz ranges) . But, on a separate receiver, I could hear no BC signals at all on the expected frequencies.

I then connected a signal generator to the SX-101A and I realized that the receiver, when on 14-MHz, is very sensitive to a carrier in the 9.5 MHz range.

So, I reconnected the antenna to the SX-101, and, with the aid of a separate receiver tuned around 9.5 MHz, I was immediately able to identify the BC stations heard on the 14-MHz band with the SX-101A.

I found the following frequency relationhips:

- apparent BC carrier frequencies on SX-101A: 14139, 14189, 14309 kHz
- corresponding BC real carrier frequencies: 9545, 9570, 9630 kHz

The frequency difference between any two 14-MHz carriers is exactly twice the real one (i.e. that in the 9.5 MHz range).

I do not believe in intermodulation, because attenuating the input RF signal (using an attenuator) cause an equal decrease of the BC signals and the real 14-MHz signals (i.e. no improvement of the wanted-signal-to-interference ratio).

I believe more in something that has to do with second harmonics, but I have not yet been able to derive the equation.

Questions

1) any idea on the mechanism by which BC signals in the 9.5 MHz range get through so strong?
2) did you have a similar experience with your SX-101A. Or, in other words, is it a design problem or an adjustment problem?

Thanks and 73

Tony, I0JX / K0JX

3807. Re: Advice on SX-101A

Newsgroup: rec.radio.amateur.boatanchors
Date: 2005-09-12 16:20:37 UTC
From: Antonio Vernucci <vernucci@tin.it>
Message-ID: <pVhVe.43803$O6.2489700@news3.tin.it>
Source record: 16396

I found a possible solution:

- with the receiver tuned at 14,139 kHz, the local oscillator works at 14,139+1,650=15,789 kHz
- should the local oscillator also have a component at half its frequency (i.e. 7,894.5 kHz), that component would convert an incoming 9,545 kHz signal to the 1,650 kHz IF
- this method also applies to the other two frequency cases

Any ideas on the reason and on the cure?

Agreed. Sell it on Ebay for 3 times what you think it's worth and you won't have to listen to people trying to persuade you that it's junk and make 5 cents on the dollar offers... or from people wanting you to ship COD.

If no other fix comes along ,do this ;connect a series resonant circuit to ground in the if path .use a small coil form and a variable cap ,tune it with grid dipper before you install it.. This circuit should be a sharp trap and can easily be tuned to the interfering frequency to remove the culprit..This may not be top notch engineering,but, it always works for me..We used to call it a suckout trap... I'd use an O'scope to look at the local osc. - see if the waveform is "funky"... If it's not a nice sine-wave - that could be the source of your "sub-harmonic"... which might cause the image you're picking up. Be careful when probing with a scope - you'll want to use some sort of weak / high impedance coupling - certainly not a direct connection with a 1:1 probe, etc. If the local is producing some odd waveform - check the power supplies / decoupling / tuning of the osc. Someone may have cranked a slug or trimmer cap into some weird tuning that "sorta" works... but not where it should be.

best regards...

Some tube manufacturers specified a maximum grid leak resistance. It was often about 2 million ohms. Drake found that much higher resistance was great for avc performance.

However, over the long run, it was also asking for trouble.

In theory, what Chuck says is true - that transconductance testers are better than emission testers. However, I can just report that in hundreds of tests I have just found a couple of cases where there was any practical difference.

I often end up getting sucked into helping others get their receiver going again. I do not charge for it and I want to get back to my own projects. The emission tester is much faster to use and I do not really care if the tube is 79% good or whether it has 10% less gain. The radio does not work when I start and I am looking for black or white, not shades of gray. Often, it is not the tubes, but rather another component. The tube tester simply eliminates the tube as the culprit for total failure.

I suppose if I were looking for a tube with the best performance for a 2 meter moon bounce preamp, I would use a transconductance tester. However, in that case, I would not use a tube at all.

I could not imagine running all the tubes of an S-85 through the test procedure for a transconductance tester - unless I had to.

This is a guess, but Utah sold a "Add-A-Unit" set of assemblies in 1937.

The 500 watt transmitter was made of kit 1, 3 and 4. Kit 1 was the exciter with 3 x 6L6 tubes and a rectifier. Kit 3 was an antenna coupling unit. Kit 2 was the modulator with P-P 6L6 tubes. Kit 4 was the PA deck with push pull Taylor T-55 final tubes and a pair of 866 tubes.

It was designed for a 1/2 rack.

If that is it, it is pretty rare.

Hi Colin,

The setup for a transconductance tester has only one extra step over the
emission tester: you have to set the grid bias. If you do the gas test,
you get two more steps: set plate resistor to specified plate current,
press button.

Emissions tester:

1) set heater voltage
2) set socket connections
3) plug in tube (start warming up)
4) set line voltage adjustment rheostat
5) set plate load resistance pot.
6) do shorts test
7) press emission test button

Transconductance tester:

1) set heater voltage
2) set socket connections (two rotary selector switches on Hickok)
3) plug in tube (start warming up)
4) set line voltage adjustment rheostat
5) set plate load resistance pot
6) set grid bias pot
7) do shorts test
8) press Gm test button

+ gas test:

1) press Gm test button and hold
2) adjust grid bias for 100umhos
3) press Gm and Gas test

Since most of the time you don't need to do the gas test, the additional step is hardly a noticable increase in effort considering the increased quality of the test.

I have tested every tube in every Tektronix scope that has come my way, and it is no more burden than doing the test in an emission tester would be. Since I have to pull all the tubes to wash the scope, I might as well test them. The complete test for all tubes in a 585A scope takes maybe 20 minutes... most of the time is spent waiting for heaters to warm up.

Many transconductance testers have multiple switch decks to move each element around. This represents a number of additional steps, over the emission tester.

And, I often can get the radio back up and running in 20 minutes - and speed is important since I do not charge for it.

Chuck no doubt is more thorough than I am - but I am only servicing an old radio and not a 50 Mhz precision scope. Incidently, one of my close friends designed many of the circuits in the 585, and single handedly designed the 519 and 130, and I have a row Tek scopes and other Tek equipment.

> Colin K7FM

Hi Colin,

My first emission style tester had a bank of switch levers, one
for each of the 12 possible pins on a tube. Each switch had
several possible positions:

1) Heater +
2) Heater -
3) Plate
4) Cathode
5) Open

The Hickok testers arrange the pins by using a bank of rotary switches,
with a separate rotary switch for each of the following elements:

1) Filament
2) Filament
3) Cathode
4) Grid
5) Plate
6) Screen
7) Supressor

For setup, it becomes a 6 of one, half-dozen of the other situation.
Either way, you have to account for all of the elements in the tube.

As to fixing a radio in 20 minutes, or less... Sure, since most radios
have fewer than 20 tubes (KWM-2 has 18). A minute a tube is very realistic.

I've done it both ways, and for me it takes as long to use an emissions
tester as it does to test the tube correctly with a transconductance
tester. There isn't a significant difference in the number of steps

either way. There is a major difference in the quality of the test.

I'll be a contrarian and ask, Do you really need a tester?

I have restored many tube radios, including some boatanchors. I own a couple of testers, but don't use them often. Usually, the tester only tells me something I could find out another way ("That's a dud -- duh").

As Colin mentioned in another post, marginal differences between tubes may not make any noticeable difference in how the radio performs. Many times, I have replaced a "weak" tube with a new one, only to find that the radio performs exactly the same.

There are exceptions, of course. The horizontal and vertical circuits in a TV may be fussier about tube condition than the circuits in a simple, consumer-grade radio.

One case where a tester is very useful is if someone gives you hundreds of loose tubes. It can quickly sort out the duds from the keepers.

The best test of all is in a working circuit for which that tube was designed.

You can test tubes without a tester if you have some working radios and known-good tubes in the house.

For example, you can test a suspect tube by putting it in the same type application in a working radio. If the radio still works, the tube is "good."

You can also do the reverse. That is, substitute a known-good tube in your subject radio and see whether the radio works better. If so, the suspect tube was "bad." If not, it was "good" (or at least you have ruled out that tube as the *sole* problem -- many unrestored tube radios have multiple problems such as leaky capacitors.)

So, ask yourself, Is this something that I really need and will use often? Or will it just be another Thing cluttering up my life?

If you're determined to get one, I'd buy a cheap emission type tester and try it out for a while. You can always buy a fancy tester later, if that seems necessary.

Just my $0.02 :-)

Are the big old-fashioned IF transformers-in-a-can available
anywhere anymore? I want to make a receiver, probably double
conversion,
which would mean that I'd want several each of the 50kHz and some
higher frequency (455kHz likely).

Are these things that can be made from scratch without a lot of
difficutly? I can wind coils etc. but don't
have any transformer slug-tuned cores.

Hi Phil,

I do no repairs, but design from scratch, so yeah, it'd be handy ;-)

I have over 1,000 tubes with many onesies, so I can't really sub too
easily. Example, a tube regulator drove me nutz. It was a bad 6AU6,
'cause when I rewired for a 6CB6, it worked :-)

Cheers!

YES. Almost every hamfest that I attend in the Chicago area has a gentleman with 455 kHz IF transformers like we are use to seeing in older tube designs. I also had replacement 10.7 MHz units for the older FM tuners. Check with the surplus houses for units.

I've a guide that lists that battery to be registered as NEDA # 927
(and no equivalent Mil #, or Burgess, or Mallory, Ray-O-Vac etc.)

...and Google was useless for me to go further too; no, it's not
'National Eating Disorders Association', it's the National Electronic
Distributors Association; but I didn't see any spec information on
their web site.

Switching tubes in a radio is a good simple test, but still requires some basic organization. I remember using a radio to test a batch of 6CB6 tubes. I tested about ten old unboxed tubes and found two of them were bad. Unfortunately, I had grouped the tubes into different groups of similar performance. A couple bad, a couple very hot, some middle of the road and so on. When I got done, I had forgotten where the bad tubes were, so had to start over again.

Before a friend died, he requested that I purchase his collection of 14,000 used tubes - which I did. Fortunately, my wife was away and I got them home and stored before she got home. It was weeks before she figured out there was something new in my collection.

But, having 15,000 tubes (I had 1,000) is something like a curse. The last time I needed a particular tube, I could not find it and had to buy one. Found it 2 months later.

I've posted a page from a mid-sixties Eveready catalog that shoes this
battery.

I checked my NEDA 1971 crossover guide as well--and it seems Eveready was
the only player in the game that made that type of battery. No equivalents
listed.

Hank, how are the cells arranged in the unit? If they are all in line then it may be possible to assemble a cluster of 4 AA Alkaline cells to fit in that space. They would have a capacity not unlike four 1/2D carbon-zinc cells.

Yep, the 130 L-C meter. Cliff needed something like that for a project and there was nothing available, so he whipped one up. It was so useful, the other engineers soon wanted one. Then Product Design got ahold of it.

I have his personal 575, too.

Neil
The 4 batteries are in series in a cambric (sp?) tube. There's room for a number of mods that I could do to get 6 volts but I thought I might be able to keep it original, its in very nice shape with all accessories. If I could find a junker or another cambric tube I might be able to install 4 standard D cells.

Buy a couple of beatup Command sets or other mil surplus and salvage. You
can always get 455Kc IF xfmrs from old tube radios. Making your own is too
much work, so salvage and spend that extra time on making a better radio.

The RCA Tube Manuals have an excellent summary of tube testers.

Many transconductance tube testers test the tube under static conditions, using dc on the grid. This is a simpler technique, but not as accurate as tests made under actual conditions. That is the reason that the best test is to install the tube in the circuit and see if it works properly. Some of the very expensive tube testers, like the Western Electric card tester, will test the tube under conditions likely to be seen in the actual circuit. The problem with one of those testers is that the tester is one large heavy suitcase and the cards used in the tester is one large heavy suitcase.

The dynamic tube tester uses ac on the grid and an ac ammeter of the dynamometer type. Transconductance is equal to the ac plate current divided by the input-signal voltage.

The summary of the RCA text is as follows:

"The tube tester, therefore, cannot be looked upon as a final authority in determining whether or not a tube is always satisfactory. Actual operating test in the equipment in which the tube is to be used will give the best possible indication of a tube's worth."

I have never seen a DC transconductance tester. All of the Hickok units
that I am aware of are "dynamic mutual conductance" testers.

That is the reason that the best test

Agreed, but I'd sure love to have one anyway.

>
> The dynamic tube tester uses ac on the grid and an ac ammeter of the

That is the method used by all of the testers based on the Hickok designs.
Testers designed by Hickok, but made by others, include, I177, TV2, TV7,
and I believe the RCA suitcase testers.

That is, of course, the reason why any tube tester is basically a luxury. They
do a good job of showing when a tube deviates drastically from the norm, but
say nothing about whether the tube will/won't work in an actual circuit. Tektronix
warns technicians not to replace tubes just because they test weak, but rather
to replace tubes that prevent the scope from meeting alignment specifications.

Getting the bandpass right could be a pain; I'd guess the
sweet spot is near critical coupling, where you'd get a
double-humped response curve. Otherwise, undercoupling
would give you a sharper peak, good for CW, or you'd have
to sweep align the strip for the desired BW.

Hi,
The static transconductance test is more commonly known as the grid-shift method. It's very old, dating from the 1920s, but can be extremely accurate, depending on the amount of grid shift (easy with modern digital meters). Grid-shift went out of favor in the US in the 1930s but most of the British AVO models use it, except with rectified AC on the plate instead of DC.

The Hickok AC-47 from 1930 had a dynamometer movement (6.25mA F.S.) and is actually a very fine instrument but was dropped in the mid-30s because of expense and the difficulty of keeping it up to date with adapters. Other than one Sensitive Research design, the last dynamometer model was Hickok's "laboratory model" 700. That beast was obsolete the day it appeared in 1951.

The Hickok Cardmatic models---123, military USM-118B, Western Electric KS 15874---can measure either emission or transconductance, sometimes both (on TV sweep tubes for instance where extra cards are provided for each test).

A while back there was a 12v tube thread.

I saw this:

http://www.thamesandkosmos.com/products/ra/ra2.html

advertized in September Scientific American. The ad (on the
builditplayit.com site) says it uses a "double triode" and
requires 8-AA batteries (nominally 12V).

I wonder if it is a 12V tube kit. Perhaps a 12AE7 or similar.

Anyone know?

There were a couple of articles in Popular Electronics in the early
sixties about doing that. And oscillator and then an amplifier,
if I remember the sequence properly. From memory, the author
referred to them as "starved circuits".

I have a vague memory of trying one of them in the early seventies,
but I honestly can't remember if I did or didn't.

The ARN-6 direction finding receiver used 24 volts on the plates of
12SN7 tubes. I wonder how well they would perform at 12 volts?

A goolgle for "space charge tubes" will probably turn up a lot
of info on low voltage tubes.

The Summer 2005 edition of Sprat, the GQRP club magazine, has a circuit
for a vfo using a XFY43 hearing aid valve/tube running off 12V. Better
stability than a fet oscillator, apparently.

A number of Australian hybrid car radios of the 1960 period used
special valves based on 12v HT but the output stage used transistors.
Heaters were 6v with pairs of tubes wired in series. Tube types
included 6DS8, 6DR8 & 6ES8 for RF, Mixer, IF and detector stages.

These sets would not have worked with dry cells due to the use of
tubes with heated cathodes.

Simon.

My project this winter is to build a single tube transmitter into an Altoids box. I am sure that has been done before, but I plan to build in the entire power supply and key.

It should work. Using an old geiger counter tube, I will use a AA battery for the filament and will first try a 9 volt battery for the plate and screen. That should be fine. If not, I will use either a 15 volt or 22 volt battery - but the 9 volt is cheaper.

Power will be low, but having a friend a mile away makes the power requirement modest. CW only.

As a kid, I built a one tube broadcast receiver using an old acorn tube and 15 volt battery for the plate.

He had a few in the shop some months ago, failing that he often has old
portable radios of 1960s vintage and he does not ask a great deal for them.
Great little surplus shop of the old fashioned type....full of all kinds of
junk .

Source record: 16345

Hello:

Does anyone have the settings for testing a 3B28 with the Hockok 539B ?

Thanks,
Bob

3857. Re: INFO: Testing 3B28 tubes

Hi,

I was about to write that the Hickok 3B38 settings should be the same
as for the 866A, but then I checked my TV-7 and found different
settings.

I tested a good 3B28 using both settings,
and got the same meter deflection.
So, testing a 3B28 with 866A settings is valid.

One disadvantage of the 3B28 compared to the 866A:
the 3B28 uses Xenon gas instead of Mercury vapor,
and thus has no visible glow. (Ah, yes, the gentle flickerings
as you modulate the Valiant...)

73,
Ed Knobloch

Might I differ slightly?? The 3B28 does have a nice glow. Not the the
same as "Old Sparky" but nice, just the same... sort of a orangish color???

On 15-Sep-2005, Bob Miller <NOSPAM@neosoft.com>made the following
observation:

> they were only $38 at Amazon.com, last I checked

These would be Super Radio III models which are very impressive for what
they are. However, Dana was looking for the i and II versions. Rumor has it
the II version runs rings around the III's.

The A is the latest model. The earlier ones are the II's and III's.

I just acquired a RCA AR-88-F receiver in great condition. Can anyone
tell me exactly what the additional knob on the front labeled
"Diversity IF Gain" does?
Does this radio have basically the same circuit as the AR-88D?

***** Yes it does! The Diversity IF Gain control allows the gain of the IF
strip to be manually adjusted when three 88Fs are used in RCA
DR89,Diversity Communication Receiver.When used as a unit receiver,turn the
Diversity Gain control fully clockwise and leave it there.The rear panel
output terminals are slightly different between the models.

AR88F is covered in TM 11-880

Brian Goldsmith.

"While valves will work with only 9 volts on the plate they are high impedance devices and so you will not get any significant power."

Depends upon what you mean significant. I just need a couple of milliwatts to go a mile. He has a little cmos oscillator going into a final transistor and keys the final transistor. The cmos oscillator runs constantly at a few milliwatts. I can hear that, even with the final disabled, so it is simply the blowby of a few mw oscillator.

Build a tube transmitter with power supply and keyer into an Altoids tin seems significant.

Geezus. Some of us hams are like audiophools. I think I have a sheet of those Brady wraparound labels in a junkbox somewhere here that somebody could have taken away from me for $5 if they bothered to ask. Not now! (Yeah, I know those cables tended to be picky about length, etc so don't lecture me about that.)
Then again some folks simply have more money than sense and that bolloxes up things for us regular folk so its NOT OK that some Mick does something stupid leaving the rest of us to pay the ultimate price afterwards.

Depends how low you want to go. I worked VK6 from 4 land with
4x2N2222As running about 750 mw out. If I had taken my rcvr to that
same relative anemic level, or if the other guy had taken his rcvr or
xmtr to that level, its doubtful that my rig would have "worked great".

hehe, as a joke, I and another guy decided to nix an obnoxious dx
buddy's success in pileups. Among many tricks, one was the signal
generator into a random-wire antenna that would effectively kill him a
half-mile away. "Hey, do you guys hear that carrier?"

You can do wonders with QRP stuff. I don't think the term "significant"
really applies.

:)

I got my whole "C" line for $350.00, including a nice set of cables. And the WORKED!!! Got them on the air daily. Only thing I really did was to repaint the cabinets, as they showed normal wear for a rig that old. It just struck me a little strange to see someone pay THAT much for a set of cables. I even got my TR-4 for only $75.00 and use it from the shop pretty near on a daily basis as well. Oh well, some folks, as you say got more money than sense.

Have a nice day!

In the 50's I used a 1T4 as a single tube crystal controlled tx on 80M. I
could often work 400 miles in the daytime. Nice little toob.

I have a couple of questions for the group regarding selling older equipment.

I recently returned from Iraq and while I was there my license expired. I don't have the time to renew at the moment due to massive repairs of the house - empty for 14 months - and I am again looking for work, so the license is not a priority ATT.

Anyway, I need advice in the best way to unload a lot of older Kenwood, Heathkit, Hallicrafters, Drake transveivers, receivers, transmitters, test equipment, etc. Some verified working, some worked when put in storage, some needs repair, re-capping, some parts only.

Besides this group, what are other successful methods of selling this stuff, EBay being a last resort.

Regards,

John C.

P.S. Please reply to the group. Thanks.

I don't know why you would so easily dismiss eBay, the single most effective way of selling ANYTHING. You will, by far, reach the largest pool of potential buyers there. I've sold a ton of stuff on eBay over the past few years with very few problems.

I also like to use the QTH.com classified ads, and QRZ.com and eHam ads are effective as well. The problem with those avenues is that you have to deal with a lot of tire kickers and others who have no intention of buying anything. If you don't already have a Paypal account, it would be a good idea to open one. You can move a lot of gear very quickly if you're not always waiting for a check or money order to come in the mail. Granted that Paypal will cost you a fee, but just bump the prices up accordingly instead of insisting that the buyer pay the fee.

If you're near a large metro area, you might also check out Craig's list. That's free to list and sell, but will reach a smaller audience than the other methods. But, it might be possible to avoid shipping hassles as most Craig's list transactions involve a face-to-face by buyer and seller.

Glad to hear that you returned from Iraq safely.

Thanks, Its great to be back! There wasn't a whole lot of fun over there.

I have a PayPal account and I'm in the process of getting verified. Its
been unused for well over a year.

The only reason I'm dismissing EBay right now is that I noticed
yesterday that an awful lot of stuff (I used Time: Ending Soonest sort
method) doesn't seem to get any bids, so it didn't look as effective as
it used to be. As a matter of fact, probably 25% of my better
acquisitions came from EBay, most from 1999 thru 2002. Competition
seemed a lot tougher then, but then again, the economy is much tougher now.

I appreciate the quick reply and I'll look into your suggestions and get
a list together soon and post it here and r.r.a.equipment.

I guess the other thing to do is spend some time reviewing these
advertisement areas and see what various equipment average pricing is
nowadays.

Regards,

John C.

I would suggest looking at completed items instead of ending soonest.
Most smart people wait until the last few seconds to bid
so looking at completed items is the only way to know what
the market is.

Welcome back.

The operative term in your question is "successful."
What do you call "success?" If you want to *give* it away
to someone cheap after you've dealt with a few dozen
tire-kickers, you can list it here or take it to a hamfest.
If you want to actually get what it's worth,
Ebay is the only way.

Just "how" long has your license been expired? You have up to 2 years to renew without retesting. Renewing is no big deal. Just thought I'd throw that in - since I didn't see you mention how long the license was out.

<snippety>

Sounds to me like you're in a great position to make the shoppers
at whatever ham radio swap meets are nearby to you awfully happy.

Check for upcoming hamfests/swap events at http://www.arrl.org and
set yourself up for the next one in your area. If you've never sold at a
ham swap before, I would be happy to offer further advice (as I've been
buying and selling at such swaps for 27 years or so).

Keep the peace(es).

I still run one, with the DG-5 freq display. I picked it up used and
dropped but it took very little work to get it up and running.
I used to have a TS-820s and a Yaesu FT-902DM, but have found that I can
do with out them. Likewise, I got rid of my Delhi tower, Ham4 Rotor,
and TA-33Jr and now use a 33 foot pine pole stuck in a hole in the ground
with home brew wire antennae.

I haven't really noticed any significant improvement other than simplicity!
I figure the TS-520S will run forever, and if something goes wrong it is
easy to fix.

The RF section on the III is pretty dreadful. The I and II are really
quite good performers on AM.

Hi,

It has been petty inactive, but I received a couple of Boatanchors
Reflector emails yesterday, and one this afternoon.
I've been browsing the member archives at www.theporch.com

73,
Ed Knobloch

Ask the library if they have an old copy of the ARRL Mobile Manual. It has a number of portable regenerative receiver designs that are pretty good.

Also, don't forget Soviet Radioteknika. They did some fun regen receiver designs well into the seventies, even some solid state ones.

I don't think the cables are critical. I have a Drake pair and all I've ever used to connect them is some generic RCA to RCA cables. I've never had any problems and in fact, I didn't even know Drake made a special set of cables to connect the twins.

For what it's worth, on eBay, you can do a search on an item
you have, then, when the list appears, in the left column, under
search options, you can check the "Completed listings" checkbox, then
hit "Show items" button to see recent sale prices. It may give you a
ballpark idea of where to start.

Good to hear you're home safe.

Hello,

I recently parted out my Johnson Viking II.
I have everything, but the Modulation Transformer.

Front panel in better than fair condition, a few scratches lettering
good, not perfect but nice. $40
Main Case $15
bottom cover $10
Top cover $15 needs slight repair.
Panel Meter (includes the shielding cover and hardware) $20
HV Plate Transformer $25
Low voltage transformer (300 volt) $25
High Voltage Choke $20
Audio Driver transformer (original) $8
Roller Inductor and tuning cap Assembly $40
Full set of Nice looking Knobs $25
Oil Filled cap $10 (8 MFD @1000 volts)
Rotary Switches, please specify $10 each

If there is something you need not listed, please email.

All shipping extra.

3916. Edmund Laport "Radio Antenna Engineering" now in paperback edition

Newsgroup: rec.radio.amateur.boatanchors
Date: 2005-09-20 06:22:39 UTC
From: dplatt@radagast.org
Message-ID: <11ivalf2vitoob2@corp.supernews.com>
Source record: 16305
Cross-posted to: rec.radio.amateur.antenna,rec.radio.amateur.boatanchors

Back in May, I announced the availability of an electronic (PDF) edition of Edmund Laport's 1952 text "Radio Antenna Engineering", which I'd created by scanning a copy of the book after I confirmed that the original copyright had expired. The reaction to this has been quite satisfying - it's been downloaded over 200 times via my BitTorrent server, and at least as much more from one or another HTTP server.

A few weeks ago, I received an excellent suggestion from Ed KI4AGL. He proposed that I upload the PDF to LuLu.com, a "publish and print on demand" company, so that people who wanted a hardcopy of this book could purchase one conveniently.

I hadn't heard of LuLu, so I checked them out, and was impressed by what I saw. It turned out to be quite easy to set up an account, upload a slightly-tweaked version of the book's PDF, create a cover for it, and make it available to purchasers. Ed ordered one, and wrote me yesterday to say that it has arrived and that it looks good - the text and pictures all came out clearly. LuLu describes their product as being "bookstore-quality paperbacks" and from Ed's report it sounds like that's a fair description.

As published through LuLu, "Radio Antenna Engineering" is a 6-by-9-inch softcover, printed on 60-pound paper stock, with a glued-edge "perfect binding". It's what's usually called a "trade paperback" edition, the same size as the original hardcover edition, and has all of the text and drawings and photographs. The large foldout map of the continental United States, with diagrams of the coverage patterns of certain MF broadcast stations, has been reduced down to fit on a single 6-by-9 page.

The price for the book is set by LuLu - they charge by the page and add a flat fee for the binding. I published it using LuLu's "no royalty, no commission" service, which they've set up specifically to encourage people to keep obscure material in print. Postage is additional, depending on how you choose to have it shipped. With basic (media-mail) postal delivery in the U.S., the book comes to a bit less than $20.

You can order it from: http://www.lulu.com/content/159004

I've added this information and link to my page at http://snulbug.mtview.ca.us/books/RadioAntennaEngineering/ on which you can find the BitTorrent download files, and links to an HTTP server which has the PDFs available.

> randy guttery

Hi Randy,

sorry for my late reply, but I have been out of town.

Thanks for the advice. By making some measurements, it was easy to determine what the problem is.

As expected, on 80 and 40 meters I measured the conversion oscillator frequency to be 1,650 kHz (i.e. the IF value) higher than the receive frequency, .

Conversely, on 10, 15 and 20 meters, the frequency meter indicated that the oscillator fundamental frequency runs at HALF the figure one would expect. For instance, when the receiver dial is at 14.000 kHz, the oscillator runs at 7,825 kHz and the converter tube then works on its second harmonic at 15,650 kHz (equal to 14,000 + 1,650). Measuring the oscillator waveform period with an oscilloscope, it was easy to confirm that the fundamental is at 7,825 kHz. The waveform is not sinusoidal and then has a rich harmonics content.

This is just the Hallicrafters design approach, not a problem of my receiver. Probably they found it easier to build a high-stability oscillator at a lower frequency and exploit the second harmonic.

But, with the oscillator fundamental at 7,825 kHz, the receiver will receive both 14,000 kHz and, even better, 9,475 kHz, unless the RF stage provides a sufficient block for the latter frequency.

Unfortunately, in Europe we have terrific BC signals in the 9.5-MHz range, that pass through the receiver RF stage tuned coils, independently of the frequency they are tuned at. Problem is that their ultimate rejection is too low, and peaking the preselector does not help at all.

The next step will be to try putting a 9.5-MHz band stop filter at receiver input.

Hi Randy,

sorry for my late reply, but I have been out of town.

Thanks for the advice, and you suggestion is just what I am going to do next.

As a matter of fact, by making some measurements, it was easy to determine what the problem is.

As expected, on 80 and 40 meters I measured the conversion oscillator frequency to be 1,650 kHz (i.e. the IF value) higher than the receive frequency, .

Conversely, on 10, 15 and 20 meters, the frequency meter indicated that the oscillator fundamental frequency runs at HALF the figure one would expect. For instance, when the receiver dial is at 14.000 kHz, the oscillator runs at 7,825 kHz and the converter tube then works on its second harmonic at 15,650 kHz (equal to 14,000 + 1,650). Measuring the oscillator waveform period with an oscilloscope, it was easy to confirm that the fundamental is at 7,825 kHz. The waveform is not sinusoidal and then has a rich harmonics content.

This is just the Hallicrafters design approach, not a problem of my receiver. Probably they found it easier to build a high-stability oscillator at a lower frequency and exploit the second harmonic.

But, with the oscillator fundamental at 7,825 kHz, the receiver will receive both 14,000 kHz and, even better, 9,475 kHz, unless the RF stage provides a sufficient block for the latter frequency.

Unfortunately, in Europe we have terrific BC signals in the 9.5-MHz range, that pass through the receiver RF stage tuned coils, independently of the frequency they are tuned at. Problem is that their ultimate rejection is too low, and peaking the preselector does not help at all.

As a matter of fact, after doing some simple research at arrl.org (doh!)
I found that a simple form will do it.

I appreciate all the answers and I'm now checking with ARAST (Amateur
Radio Ass. of the Southern Tier (NYS) as they have a ham fest coming up
this weekend. I'll check my options with them as well as put together a
list for this group.

My main concern with EBay is shipping, as some of this stuff is heavy,
to put it mildly; things like a couple of Hallicrafters Receivers &
transmitters, 2 pairs of Kenwood 599 Rx/Tx, a couple of old heathkit
Tx/Rx and test equip, plus...

Its a big list :-)

Thanks to everyone for answering my original post, and again, its
absolutely great to be back.

John C.

Brian,

these are very strong BCs speaking languages sometimes difficult to identify.

Examples:
9,330 kHz speaking French S 9+40
9,345 kHz speaking unidentified language S 9+30
9,355 kHz arab music S 9+40
9,375 kHz arab music S 9+40
9,390 kHz seems to be dutch S9+60+++
9,410 kHz BBC world service in english S 9+60
9,420 kHz arab music S 9+50
9,440 kHz speaking english S 9+40
9,460 kHz speaking unidentified language S 9+60
9,480 kHz speaking portoguese S 9+60
9,495 kHz speaking unidentified language (arab?) S 9+60++++
etc.
etc.
etc.

Don't you hear them in the US? Lucky man.

Hi Randy,

sorry for my late reply, but I have been out of town.

Thanks for the advice, and you suggestion is just what I am going to do next.

As a matter of fact, by making some measurements, it was easy to determine what the problem is.

As expected, on 80 and 40 meters I measured the conversion oscillator frequency to be 1,650 kHz (i.e. the IF value) higher than the receive frequency, .

Conversely, on 10, 15 and 20 meters, the frequency meter indicated that the oscillator fundamental frequency runs at HALF the figure one would expect. For instance, when the receiver dial is at 14.000 kHz, the oscillator runs at 7,825 kHz and the converter tube then works on its second harmonic at 15,650 kHz (equal to 14,000 + 1,650). Measuring the oscillator waveform period with an oscilloscope, it was easy to confirm that the fundamental is at 7,825 kHz. The waveform is not sinusoidal and then has a rich harmonics content.

This is just the Hallicrafters design approach, not a problem of my receiver. Probably they found it easier to build a high-stability oscillator at a lower frequency and exploit the second harmonic.

But, with the oscillator fundamental at 7,825 kHz, the receiver will receive both 14,000 kHz and, even better, 9,475 kHz, unless the RF stage provides a sufficient block for the latter frequency.

Unfortunately, in Europe we have terrific BC signals in the 9.5-MHz range, that pass through the receiver RF stage tuned coils, independently of the frequency they are tuned at. Problem is that their ultimate rejection is too low, and peaking the preselector does not help at all.

You should measure the L.O. Signal at the 1st mixer. Low injection voltage can cause lots of strange intermod problems.

Tony....

I think there is something wrong. The manual I downloaded from BAMA says
the oscillator frequency is ABOVE the signal frequency on ALL bands!

Yes, I'm being a bit flippant but hear me out. One of the concepts of an auction is to toss a piece out there as a means of unloading it and let the market decide what its worth...or at least facilitate them to get into a bidding war if there is more than one interested party.

A 'retail' price tag on a rig that a reputable radio guy is unable to repair is a death blow to a sale.

I don't think your $99 expectation for a hosed up SX-122 is an unreasonable goal. But that sounds more like an ending price than a starting price.

Me? If I wanted to sell it and clear space in the shack I'd list it with a frank opinion that its screwed up beyond hopeful, simple repairs for 0.01 and let the market do its work. From my experience that works better than "I want $100 for a radio that I deem as unrepairable".

Its a selling psychology thing, ya know...not a personal affront.

The banded Black Beauties are a no-brainer. Chuck 'em. If those "Tiny Chief" are the pink ones they are a no-brainer too...but ya just can't recoup your 'operating costs' with them like you can with an ebay sale of old BBs :)

Domino caps? If they are large values like .001 or greater then they are most likely paper caps (not mica) and all of the above applies. The mica cap failure rate seems to be increasing these days so you can't always rule them as 'good' but the paper Micamold guys must go for long term reliability.

Seems to me that the black capacitors that look, and are
marked like "postage stamp" micas, are actually paper
dielectric.

What Bill said.

For future reference, the article at http://antiqueradio.org/recap.htm has advice on replacing capacitors and some info on distinguishing the various types and reading their values.

In case you don't already have the schematic, it can be downloaded from:

ftp://bama.sbc.edu/downloads/hallicra/sx110/

Hi All,
Just goes to show that moving DOES have its good side. While packing, I found what appears to be an original National bottom cover plate for the NC57, NC57B and NC57M. Looks like a factory manufacture, not a homebrew. It even has the stains where the 2 little product labels were. The little cover plate for the alignment holes is gone, the cover plate fairies got that one. I don't know what to ask for it, so I will accept offers for a week and then let the buyer with the best offer know that he/she has won. Figure $5.00 for shipping in the continental U.S. It just goes to show that not EVERYTHING goes directly to eBay.

Hi Roger,

what you say is interesting.

I have an original SX-101A manual, which I presume should be the same as the BAMA copy. Could you please tell me at which page you read that? In my manual I was unable to find any mention of the oscillator frequency.

I am pretty sure of the oscillator frequencies, as I measured them both with a frequency meter and with an oscilloscope (the oscillator waveform period on 20 meters is somewhat longer than on 40 meters, no question about that). And the strong 9.5 MHz phantoms frequencies are exactly what they should be with an halved oscillator frequency.

On the other hand my receiver was owned by a person who never put his hands in it, but even hypothesizing that someone did something in it, what could he have done to make the oscillator frequency exactly half of what one would expect to be, and on 10, 15 and 20 meters only? Halving the oscillator frequency would cause the dial scale to be no longer correct; matching is instead fairly good (with normal tolerances for a receiver of that kind).

Roger,

I carefully re-checked the manual and I found the text you mentioned.

It literally reads: "The 1st conversion oscillator operates at a frequency higher than the incoming signal by an amount equal to the first intermediate frequency of 1650 kc/s"

That sentence clearly states that the beat frequency is higher than that of the incoming RF signal but, in my opinion, it does not absolutely also imply that the beat frequency corresponds to the fundamental oscillator frequency.

In other words, it is true that the beat frequency is always higher than the incoming RF signal, but the beat frequency could be obtained by taking the second harmonic of the oscillator frequency. And the sentence would still be meaningful.

I am taking that interpretation as I am 101% sure that, on 10, 15 and 20 meters, the beat frequency is twice the fundamental oscillator frequency.

I counted 5 or 6 how to build articles at the ARRL site.

Or, go to Google and enter "How to build a regenerative receiver" and
there are many more articles.

In addition, my 1958 ARRL Handbook also has an article on a one-tube
regenerative receiver. I imagine you can find that in any of the older
handbooks that are on Ebay for a couple of dollars.

Otherwise, the guy can buy the QST CDs that are, I believe, $39.95 per
decade, going back to 1915 or so.

Hi Tony....

It's on page 15 under RF ALIGNMENT. It's the last sentence before the actual proceedure. I have no idea what could be wrong with your receiver but to use the second harmonic for mixing is very unusual. The only time I've seen it used is when a manufacturer was trying to add a "VHF" band to an early receiver and couldn't get reliable oscillation at the fundamental frequency.

Hi Tony....

The "beat" frequency is generally the difference (IF) frequency. In a receiver the "beat frequency oscillator (BFO) is used to generate a "beat" frequency in the audio range for CW reception. My copy of the manual clearly states that the OSCILLATOR frequency is HIGHER than the signal frequency on ALL bands.

Well, I used the wrong term - beat frequency- due to my limited command of the English language.

In summary, what I am trying to say for the sake of justifying what I measure here is that the sentence "the oscillator frequency is always higher than the signal frequency" should have been more precisely written "the frequency used to convert the incoming RF signal to IF is always higher than that of the RF signal". In this way the sentence would become compatible with using the second harmonic of the oscillator for converting the RF signal (on 20 meters the measured fundamental oscillator frequency is lower than the RF signal, but its second harmonic is anyway higher).

Anyway, I agree with you that using the second harmonic of the oscillator is rather odd, but it is a fact that, in addition to the frequency meter and the oscilloscope measurement results, the phantom carriers coming from the 9.5 MHz band are exactly where they should be if the second oscillator harmonic is used.

It looks like a kind of a mistery. I hope that an SX101A owner will take care to measure the oscillator frequency at his first convenient occasion.

73

Tony, I0JX

the SX-101A, the frequency that converts the RF signal into the IF signal is always higher than the RF signal. This is absoultely true, on the other hand the receiver dial shows the same sense on all bands (if, on a certain band, the frequency that converts the RF signal into the IF signal would be lower than the RF signal, then the relevant dial would go in the opposite direction).

Agreed.

Hi all,

I'm looking for parts to repair a T-22/ARC-5 transmitter
that was damaged in shipment. I need the roller coil,
but only the coil itself, not all of the brackets and
the roller contact. This part must from from a T-22 or
equivalent 7.0 - 9.1 MHz transmitter. I also need a top
cover with the black wrinkle finish, which can come from
any ARC-5 transmitter, but it would be nice to have one
from another T-22 so that the nameplate on the top would
match. I'd like to have the mirror in place over the
1629 tube. I would prefer to buy just the parts I need,
but if I have to, I'll buy a complete or incomplete rig
if the price is cheap enuff.

Whatcha got?

73,
Dean K5DH

Anyway, I agree with you that using the second harmonic of the oscillator is rather odd

[SNIP]

Oh, I don't know. The Heath HR-10 ham receiver, while admittedly in a lesser league, did this on 15 and 10 meters and admitted it. I would strongly suspect that many of the lower end sets did this, but didn't fess-up.

I am not sure of their rationale. Perhaps the stability of 30 MHz oscillator is, in practice, more than twice worse than that of a 15 MHz oscillator, so they preferred to work at lower frequency and take the second harmonic. They did not even care to filter the oscillator frequency so as to remove the fundamental and leave only the harmonic.

By the way I put a parallel LC circuit in series with the 20 meter RF input transformers, and, adjusting its for resonance around 9.6 MHz, the BCs disappear completely. Adjustment is quite critical and the resulting BCs attenuation is tremendously high.

I'm not sure. This is what the ARRL web site says:

QST View CD-ROM 1915-2004
-- Back issues of QST in convenient, space-saving CD-ROM format. Each
pageï¿½all the ads, articles, columns and coversï¿½has been scanned to
provide a black-and-white image that can be read on your computer
screen or be printed. Easy-to-use software included on the CD allows
you to:

* Search for articles by title and author.
* Select specific year and issue.
* Browse individual articles or columns.

I have bought them all and newer ones have color.
The scanned pages are in TIF format.
The added software provides some search ability but does not
search for specific text by looking at all the scanned pages.
I would suspect the search part of the programs only have
indexes to article titles authors etc. It can only provide
search results for what has been programmed into that
search database. I have not been disappointed by the
CD with one exception. You can not copy/move all
the CD's to one hard drive on the computer and have a
look or search. SOOOO you are left with LOADING
and searching one CD at a time. The search tool database
does accumulate all the files so you can use the search tool
that is provided. But still a pain to load and look one at a time.
Something to do between band closings eh.

I think the common viewing tool is Adobe... one version or
another from the ARRL disks.

The TIF files and Folders are sort of date coded names so
you can just browse through them with any viewer that
will read TIF files. For example the folder with a file in
it named 7403001 would be the 1974 March cover page.
FWI 75 cents cover price then LOL

My Windows XP picture viewer displays them ok.

The individual TIF files can be copied to the hard drive
so you can get a group of some series of articles
together and view and work from one folder for
convenience.

Sorry not taking any orders.
The few folks I have helped with an article didn't even bother to
send a thank you email. blnt

Pay some$$$ for CDs to the ARRL and support the hobby.
Numbers count.

I'll have to second the motion. In many WW2 sets that I've either gotten on the air or working on, the postage stamp micas are becoming almost 90% bad. In a BC-669D, I had to change out 100%. My position is, if I'm in there already, I'll just finish the job. I'll add that some mfg of small screwdriver-adjusted variable caps, used in the RF/MIX/LO circuits or receivers (typically), are shedding their retaining collars (split open) and allowing the plates to short. Worst cases have been BC-312/342, RMB/RBS, and a few others.

Of course, QST didn't have color until after they went to the larger size in 1976, though I can't remember if the color came immediately with the change.

There were a few exceptions, where they'd add a single color to a cover photo for special occasions or reasons.

OK I haven't got the window skills for fooling around with much on my computer.
I started in the computers building my own back in the Motorola 6800 micro days.
Since all the years passed I fell into more of just a user. Was a lot of work to try
and keep current over the years and eventually stopped.
Anyhow, Thanks I may give it a try.
It sure would make wading through the CD's easier.
Hmmm... that's not like a wedding registry huh. LOL

Any clue as to hard drive space used for all the CD's?... might have to put them on
the desktop. Notebook I use might run me dry on space.

I just had to go and buy an OLD memory stick for my 2 year old Sony GRZ530 notebook.
The dip-stick that wrote an update patch to read the new "memory stick Pro" made
the patch REQUIRE the old memory stick to upgrade the computer. I bought a new camera so I could be current with the storage. I had an older Sony camera
that used 3.5 floppy and NO floppy in the Sony GRZ530. They could have wrote the patch to use a 20 cent CD-R but instead forced me to find and buy a $40 old piece of memory I'll never use again. Maybe I can sell it to another
owner of a GRZ530 in a few years and make a profit.
They quit making it and I spent several store trips to find one. UGH!!
What a hose job. Not related to boatanchors I guess but that's why some folks
are migrating back to the boatanchors eh. Fewer things to break, fewer things to fix.
Hmmm... now where were my 2m crystals at?

I am resoring a pair of Hallicrafters S-40B recieivers. I started fiddling with these radios about ten months ago. Initially, I just recapped one and cleaned it up to give my father as a Christmas gift. I worked OK, but was seriously in need of reallignment. The second S-40B I was planning on rebuilding for myself.

When I tried to reallign my father's radio, I found that it would not reallign on several bands. This problem, in addition to the poor condition of my own, led me to decide on a complete rebuild of both radios from the ground up (all new caps, resistors, and transformers). I worked off of schematics for the S-40B that I downloaded off of the BAMA web archive.

Recently, I got both chassis ready to try out. They both worked ok, but I noticed a new problem on both radios that I didn't see on the first restoration (new caps only). When I turn the RF gain pot up beyond approximately 66% of full rotation clockwise, the radio sensitivity drops significantly and no stations or normal static can be heard. When I back off on the gain control, the radio returns to normal. I am guessing that this sympton (observed on bot radios) is from RF amplifier overload. Is this behavior normal for a tube radio, and is there a fix? These are the first boatanchors that I have ever tried to work on, so all of this is a new experience to me. In all cases, I had the radio hooked up to a 100 ft. random longwire antenna.

If this behaviour is a symptom on a goof-up on my part in rewiring the sets, I would appreciate some advice on how to fix the problem.

Hi,

It sounds like you no longer have automatic gain control (AGC)action.
The AGC circuit should provide a negative voltage to the grids of the IF
amplifier tubes, to reduce their gain with strong signals.
Lack of AGC would lead to "blocking" which is as you describe.

The "RF gain" control really is not just RF gain. It is RF and IF gain.

With the sensitivity pot set to highest gain AND AVC on, the receiver won't overload except on very strong (local) signals. Normally no overload will be perceived.

If the AVC is off, the receiver will overload about as you describe.

Since the receiver does not have a product detector, for CW and SSB the AVC will be off and sensitivity will be set to avoid overload. For AM signals

use AVC on and full sensitivity unless overload is discerned, then reduce sensitivity.

Don

What would cause a lack of AGC action? I was operating the radios with the
AVC off when I noted the apparent RF gain saturation. Would a lack of AGC
be a result of the radios being misalligned, or is it symptomatic of a
component failure?

Hi,

If you were operating the radios with the AGC off,
that would cause the blocking action at the higher gain settings
which you noted.

The S-40 radios are intended to be used with AGC switch "on" in A.M. mode.

AGC "off" is intended to be used only with the BFO on (for c.w. reception).
This is because the beat frequency oscillator would otherwise
be detected by the AGC circuit as if it was a very strong received
carrier, which would cause an unwanted constant reduction in the
receiver gain by AGC action during c.w. reception.

Hi Gang:

I have an excellent copy of the Instruction Book for the Collins 30L-1 amplifier that is surplus to my needs. It is the 2nd Edition dated 15 June 1961. It is an excellent copy with the full pull-out schematic, and hardly distinguishable from an original. I am asking $7.50 including postage.

If interested please reply by e-mail. Note that my address has been slightly altered to avoid SPAM.

Hi Gang:

I have an excellent copy of the 35 page Instruction Manual for the R L Drake R-4 Receiver that is surplus to my needs. The cover is slightly "wavy" and slightly blemished but the manual copy is a very good one and is hardly distinguishable from an original. It is bound at the top with a couple of tie wraps which makes it easy to flip through and look at while working on the radio. I am asking $7.50 including postage.

If interested please reply by e-mail. Note that my address has been slightly altered to avoid SPAM.

4000. FS: Cover and AC Power Cord for AN/USM 159A Frequency Mter

Newsgroup: rec.radio.amateur.boatanchors
Date: 2005-09-26 10:40:15 UTC
From: Michael Crestohl <W1RC@notmyrealaddress.net>
Message-ID: <6cmej19f0lakj0msism030provdtdeh7vr@4ax.com>
Source record: 16289

Hi Gang:

I found this in the basement and don't need it because I don't have this piece of equipment. I can't even recall how I came to have it. If you have one of these freq meters (with the cool film strip readout) missing the cover here's your chance to pick it up. It is in very clean condition; paintwork is excellent with a couple of die-size abrasions on the front. Rubber sealing gasket is excellent. The AC line cord is also there but the plug is missing. I'm asking $15.00 plus postage for it; any takers? Please reply by e-mail.

Tnx es 73,

Michael, W1RC

FOR SALE: Antenna Switch/ Transmit/Receive Switch
I have several of these that are surplus to my needs. All are
tested working and clean.

DOW KEY :

Part number: 77- 220232 7307
Operating Voltage: 28 VDC
Connectors: BNC-Female connectors.
Comments: Apparently never used (no solder traces on electromagnet
terminals)
Price: $20.00

Part number: 84-BSN
Operating Voltage: 48 VDC
Connectors: N-Female
Price: $20.00

60-222542
220 Volt DC
Connectors: Type N
Price: $30.00

Other:

Advance Electric & Relay
Operating Voltage: 120 VAC
Connectors: Type N
Price: $20.00

Manufacturer: Amphenol
Part number: 17-10242-3
Operating Voltage: 26 VDC
Connectors: N-Female
Comments: New in factory-sealed bag.
Price: $15.00

Manufacturer: Danbury Knudson for Motorola
Part number: 80C4298
Operating Voltage: 6 VDC
Connectors: 1 solder 2 BNC-Female
Comments: New in factory-sealed bag.
Price: $15.00

Manufacturer: Sperry Products, Danbury Knudson
Part number: R-142S CHB005AO

Operating Voltage: 12VDC,
Connectors: SO-239/BNC-Male, Solder tabs.
Price: $20.00

Plus postage.

If interested please reply by e-mail.

Read the instruction manual carefully. A careful reading should tell you how the avc switch works, and your description sounds perfectly normal if the avc switch is off.

Very few transformers need replacing. They are simply wire on an iron core and unless the wires corrode due to moisture, they will last much longer than the owner. It would be difficult to find transformers that are exact match for the original.

Colin K7FM

4003. BC-348 modified for use as a BC-342 and BC-312.

Newsgroup: rec.radio.amateur.boatanchors
Date: 2005-09-26 15:05:03 UTC
From: novatech@eskimo.com
Message-ID: <dh92mv$e0q$1@eskinews.eskimo.com>
Source record: 16292

Here's an odd ball that I discovered for myself-- probably you old boatanchor people already knew this.

Hallicrafters built what they called the BC-348/342 for line powered replacements for the BC-342 with a factory installed power supply and the tubes wired for 12v. They also had a BC-348/312, which was a dynamotor version designed to run on 12v (closer to a BC-224).

These seemed to be intended to go into the SCR-299/399 as the extra FT-178 brackets are part of the assembly.

I couldn't find a date or a reference to the Signal Corps anywhere in the manual. The schematic shows a 6v6 for the output tube, so they weren't made from the older BC-348.

Anyone know more about this? I am curious if anyone has ever seen one of these. They'd be pretty obvious, a BC-348 box with the BC-342 big connector on front.

TIA.

Steve.

Yup,

I have the instruction / maintenance book by Hallicrafters for the 348/312
and 348/342

No date on the manual or anywhere inside.

First picture in the mnaual is that of what appears to be a 348 with the
'ugly plug' of a 312.

You can still find junk AA5 radios in the trash from time to time and rip out their 455khz if cans. 85khz transformers from arc-5 radios are STILL out there at hamfests, and the bc453 radios they came from show up often on ebay. I think I have a few of these cans in my junk box. You can pad them down to 50khz if you want, but there is nothing wrong with the 85khz if frequency. The arc5 cans have a feature where the spacing between the primary and seconday windings is variable. Remove the top cap and pull up on the fiber rod to increase the spacing, push down on it to move the windings together. With the windings spaced out you get a nice sharp peaked bandwidth, with the windings together they are over-coupled and you get a bandwidth well suited for ssb phone,
A Q multiplier and/or t-notch filter both work well at this frequency.

Some of the ARC-5 85khz cans had tapped windings to get better Q by connecting the grid and plate of the tubes 'below' the high impedance end of the coils by a few percent. If you exchange the hot and cold ends of the coils, the taps might work out well for bipolar transistor impedance matching connections!

4012. NOS Electrolytic caps

Newsgroup: rec.radio.amateur.boatanchors
Date: 2005-09-27 03:02:52 UTC
From: yzordderrex@verizon.net
Message-ID: <1127790172.138848.106160@g47g2000cwa.googlegroups.com>

AES sells NOS electrolytics and claim 'recently reformed' Would these be any better than what's in the radio? I suppose years of using the capacitors is more likely to dry out the electrolyte than years of sitting on the shelf.

Any comments?

My boss gave me a bunch of 68uf/450v caps that I intend to hollow out the big shiny cans and stick my free caps in. It takes a little bit of time and epoxy, but worth it.

Message-ID: <TNWdnfY_1-1dIqXenZ2dnUVZ_sidnZ2d@giganews.com>
Source record: 16203

Using any old electrolytic is a crapshoot. Why would you risk your expensive power transformer running with original or "recently reformed" old capacitors?

Burn up a couple of power trannies, as I have done to my dismay, and you will use only "NEW NEW NEW" electrolytics.

The new caps are cheap and very reliable. And it's not hard to stuff them into the old containers, as you noted, if you want to preserve the original appearance. I could teach a 12-year old how to do it in 10 or 15 minutes.

I'd think a bit less than $200 for the TR-3/RV-3, including power
supply, in the condition you describe.

While I agree with much that has been said about new caps being better,
AES has a fabulous reputation and I doubt they would risk it over some
capacitors. If they fail, send it back and you'll probably get them
replaced or money back.

Cool! Will they replace your transformer too? ;-)

As long as the NOS capacitor is still wet inside, it should reform if you do it properly. Properly is with a power supply set to the WV, and a 1K (or higher) resistor in series with the cap. It should take less than 1 hour for the cap's current to drop to a few microamps. I have never had a cap that has been reformed this way fail. (It is, after all the way the manufacturer brought the cap up in the first place.)

I have had plenty of failures when I try and cheat by bringing up the mains voltage slowly with a variac.

4030. Decals - Hallicrafters S-40, 76, 77 series

Newsgroup: rec.radio.amateur.boatanchors
Date: 2005-09-28 15:27:20 UTC
From: Bill <exray@coqui.net>
Message-ID: <72502$433ab65a$4232bd61$3361@COQUI.NET>
Source record: 16219

I now have some decal sets available for these models. The one set should cover the various A/B/U versions of the 40-76-77.

The green ones did not come out well. I've been struggling with various printer people and the bottom line is that the correct mint green color simply isn't obtainable from an ALPS printer. On this set of decals the printer guy attempted to half-tone the green which I don't think looks very good. The alternative is a green that seems too dark. But, if your set is one of the all-white versions you'll be in good shape.

Here's a scan...decide for yourself. (Yeah, I'll clean the scanner glass next time...those dirty spots are not on the decal)

http://www.sparkbench.com/s40rad.jpg

Price is $10 per set plus $1 US Shipping or $2 International shipping. Limited quantity.

Drop me an email if you are interested.

Thanks,

Bill WX4A

For a near-mint Drake L-4B with full output tubes,
I'd say upwards of $700.

73,
Ed Knobloch

Does it have a mic?

Any extra filters?

SWR/power meter?

Does it come with a linear amplifier?

How 'bout a three element beam?

What condition is the beam?

Can you bring it to my house for a demo?

Can you supply a shack to operate it out of?

Don't worry about the BPLosaurus. It's on the verge of extinction.
Too many other kick ass emerging technologies. 60Hz power lines are
just that.

regards,
N9NEO

I don't know what to make of this one. I wasn't really concerned about BPL, which I figured was doomed right out of the box. But this isn't quite the same thing. There's no wild claims of reliable widespread community internet access through miles of radiating power lines. This promises local networking, within the home. Not just computer networking, but all sorts of electronic doo-dads might be networked. While I doubt networking adds much value to a refrigiderator, I can imagine people would love to move their computers, printers, TV sets, stereo speakers, DVD players and whatever, wherever they want without having to worry about RCA connectors, F connectors, parallel port connectors, S video connectors, binding posts, USB ports or any of the other confusing nonsense. Just plug it in to the outlet, and it works -- at least, that's the promise.

Will it work? I don't know, but it doesn't have the overambitions of BPL. The potential market for this one is much larger than BPL's potential market. And it sure looks like it will cause SW interference on a local level, even if not on BPL's regional level.

Thanks to the thunderous lack of response from this newsgroup, I have moved my rare STR-5 "strip receiver" to the big auction site.

A real cold war relic, the STR-5 was made in TMC's Ottawa plant, serial number 4.

It has a door on the front, where you plug in a module that sets the frequency of the radio. The module has a crystal oven, and room for two sets of crystals (the second channel requires an optional second receiver IF board which was not installed on this radio). I imagine they had a rack nearby, keeping these modules in hot-standby temperature mode, and would swap them out with the peacetime modules should the need arise.

BTW, it is Technical MateriEL Corporation (spelling). They adopted the British spelling of Material.

With Google's $100,000,000 behind it, it WILL work.

Thats why I am supporting a worldwide boycott of Google and it's
customers (the sites that have "ads by google" and their advertisers).

Geoff.

>I don't know what to make of this one. I wasn't really concerned about BPL,
>which I figured was doomed right out of the box. But this isn't quite the

BPL itself it probably not doomed at not least for the utilities. They
see it as a way to not only do automated meter reading, but load
leveling/demand control as well. Of course those things can be
handled nicely by the low frequency stuff they use now, but remote
visual monitoring will require much more bandwidth. Many see it as a
way of getting the consumer to pay for the costs of more advanced
monitoring.

>same thing. There's no wild claims of reliable widespread community
>internet access through miles of radiating power lines. This promises local
>networking, within the home. Not just computer networking, but all sorts of
>electronic doo-dads might be networked. While I doubt networking adds much

This is old stuff. The only thing new is the chip. It's the home plug
system and what the BPL crowd hope to use and are using at the home
end of their feeds. OTOH there are many home plug systems in current
use that have nothing to do with BPL.

However the article is a bit generous when it talks about the
technology probably being used in Europe and the US due to the more
strict regulations in Japan. What he should have said is BPL is under
more strict regulations, it is *BANNED* in Japan.

>value to a refrigiderator, I can imagine people would love to move their

They are talking about smart appliances where, in this case the
refrigerator would run diagnostics and if any thing such as pressure
is out of spec it'd call home reporting it needed service before
actually failing.

>computers, printers, TV sets, stereo speakers, DVD players and whatever,
>wherever they want without having to worry about RCA connectors, F
>connectors, parallel port connectors, S video connectors, binding posts, USB
>ports or any of the other confusing nonsense. Just plug it in to the
>outlet, and it works -- at least, that's the promise.

It does take a modem for the computer that plugs into the socket, but
yes, you could put the thing any where in the house.
Like a dial up moden that can plug into any phone outlett, this modem
could plug into any electrical outlett.
>
>Will it work? I don't know, but it doesn't have the overambitions of BPL.

Yes, the home plug system has been in use for some time.

>The potential market for this one is much larger than BPL's potential
>market. And it sure looks like it will cause SW interference on a local
>level, even if not on BPL's regional level.

The interference, so far, has been confined to next door neighbors.
According to the reports on some forums you had best hope your
neighbor doesn't purchase one of those Ionic Breeze air filters.

I do wonder about ingress though. As with BPL a 5 watt signal from
100 feet will block almost any system completely (with the exception
of the Motorola which uses hard filtering)

I do some DXing which means I run the legal limit on all bands with
directive antennas. Based on the 5 watts at 100 feet I should take
out any BPL up to a bit over a mile on 20, 15, 10, and 6 meters while
40 and 75 would be about a quarter to half mile and 160 would be maybe
a city block. The 75 meter half wave slopers to the NE (Europe) ends
within 50 feet of the local power line. The one to the sough ends
within a 150 feet of the power line. The one to the NW is pretty much
in the clear. The 40 meter antennas run pretty much in the same
directions but I hope to have a 40 - 10 yagi up soon. As I'm also
setting up for digital including RTTY and WSJT, I don't think it'd
take much of a transmission to shut down quite an area. With the
power levels and antenna gain the ERP might even keep the neighborhood
RF quiet.

>
>Frank Dresser

Here's the industry website of The Devil himself....

http://www.uplc.org/

4068. vintage broadcast equipment

Newsgroup: rec.radio.amateur.boatanchors
Date: 2005-10-02 03:02:35 UTC
From: "G.T. Tyson" <gtyson@nc.rr.com>
Message-ID: <f5I%e.79051$Jp.2545874@twister.southeast.rr.com>
Source record: 16157

This may be slightly off-topic for this particular newsgroup, but I figured I'd take a shot at it. I have the following items of vintage broadcast equipment, and you lucky folks are getting first crack at 'em before I take the lot to Ebay.

1 Gates M-4990 frequency monitor, used at a station on 930 AM

2 McMartin TN-77CB FM SCA recievers, used for Muzak subcarrier on a station on 93.3 FM

The items described above use tubes. They were functional when removed from service, and when I plugged them in, the tubes lit and nothing smoked. The following items are solid-state:

1 Zercom ZM2-10 remote broadcast telephone amp, used at station remotes. Contains 2 mic channel inputs, space for 8 D batteries, w/rotary dial.

1 NAD 4020B AM-FM stereo tuner, linear dial, used as an air monitor

1 McMartin LX-40A mixer-preamp, 4 input channels, horizontal VU meter

1 Plectron R-720 weather radio, vintage 1976, tuned to 162.40 Mhz, tone frequency 1050 hz, has built-in whip antenna and input for external antenna, works on either 115 VAC or 12 VDC

Approx. 30 broadcast tape carts

If you'd like to make an offer on any or all of the above items, please email offlist.

G.T. Tyson
Greenville NC

Which consumers will pay the costs? The power consumers or the presumed
broadband internet over powerline consumers?

Now that I think of it, they could try to sell a BPL security camera for
every utility pole, and ask the police departments to pay for it.

Yeah, you're right. I was going to comment that this Panasonic plan looks a
lot like an upgraded version of the homeplug standard.

True, but I don't think the average consumer much cares about such
over-hyped geekoid stuff as networked appliances. I'd be far more impressed
with a chip which reduced power consumption by 20% or so. Besides, most
current appliances are already highly reliable. Computerizing appliances in
an attempt to increase reliability might be, at best, a wash.

How much RFI does a home plug system make? I have no expirence with
homeplug, but I'm imagining it's on the order of a poorly filtered
switchmode power supply.
